

## HOW TO SOLVE DRUG CALCULATIONS

- Identify what type of drug calculation you are. First step, you cannot solve the problem or write an answer. In many cases, drawing a picture that visually represents the problem is often a helpful strategy.

- Remember that a formula often used for working out how many tablets to take or how to draw volume exactly as required is:

$$\text{Volume required} = \frac{\text{Strength required (mg)}}{\text{Stock strength (mg)}} \times \text{Volume of stock}$$

**TIP:** An easy way to remember this formula is:  
**Volume reqd**  
**Stock strength**

- Remember that a formula often used to work out the number of drops per minute delivered by an intravenous infusion is:

$$\text{Drop rate (dpm)} = \frac{\text{Volume (ml)} \times \text{Drop factor}}{\text{Time (hr)} \times 60}$$

**NOTE:** Drop factor for drip set volume

- Remember that the intravenous infusion, sometimes you are asked to calculate volume, time, or rate, and the following formulae can be useful.

$$\text{Volume (ml)} = \frac{\text{Rate (ml/hr)} \times \text{Time (hr)}}{1}$$

$$\text{Rate} = \frac{\text{Volume (ml)}}{\text{Time (hr)}}$$

$$\text{Time} = \frac{\text{Volume (ml)}}{\text{Rate (ml/hr)}}$$

- After applying the formula (if relevant), or calculating an answer using common sense, go back and check if your final answer shows the same logical outcome of what you need.

### EXAMPLE 1: DRUG MADE UP FROM STOCK SOLUTION

This example illustrates how to work out solutions for orally taken drugs made up from stock solution – for example, working out how many ml to inject when the drug is in a stock solution.

**QUESTION:** A patient is ordered 750 mg of penicillin. What the volume required if the stock solution contains 100 mg of penicillin per 2000 ml.

**TIP ANSWER:** We'll be using this formula:

$$\text{Volume required} = \frac{\text{Strength required (mg)}}{\text{Stock strength (mg)}} \times \text{Volume of stock}$$

- Here above the strength of medication that patient needs and the stock strength.

**Strength Required is 750 mg. Stock strength is 100 mg in 2000 ml.**

**At this point our rough answer is – Since that's 1 ml, and is 100 less than 2000.**

- Now you need to do the same, convert 750 mg to mg by multiplying by 1000.  
 e.g. 750mg x 10 = 7500mg (not 7500mg = 750g)

- Now put the values into the above formula.

Now that 750g (what the patient needs) is a very small part of 7500mg – so input your answer to it to be less than 2000ml

$$\text{Volume required} = \frac{750}{7500} \times \frac{100}{10} \times \frac{2000}{1000} = \frac{750}{7500} \times \frac{10}{10} \times \frac{2000}{1000} = 2 \text{ ml}$$

**ANSWER:** Based on the above, your answer is 2.0ml

#### **Human Rights and Drug Control** Melissa Bone,2019-10-10

This book uses a human rights perspective developed philosophically politically and legally to change the way in which we think about drug control issues The prohibitionist approach towards tackling the drugs problem is not working The laws and mentality that see drugs as the problem and tries to fight them makes the drugs problem worse While the law is the best placed mechanism to regulate our actions in relation to particular drugs this book argues against the stranglehold of the criminal law and instead presents a human rights perspective to change the way we think about drug control issues Part I develops a conceptual framework for human rights in the context of drug control philosophically politically and legally and applies this to the domestic UK and international drug control system Part II focuses on case law to illustrate both the potential and the limitations of successfully applying this unique perspective in practice The conclusion points towards a bottom up process for drug policy which is capable of reconfiguring the mentality of prohibition This book will be of interest to students and scholars of human rights criminal law criminology politics and socio legal studies
