Flowback and Produced Waters National Academies of Sciences, Engineering, and Medicine, Division on Earth and Life Studies, Water Science and Technology Board, Board on Earth

Sciences and Resources, Roundtable on Unconventional Hydrocarbon Development, 2017-02-27 Produced water water from underground formations that is brought to the surface during oil and gas production is the greatest volume byproduct associated with oil and gas production. It is managed by some combination of underground injection treatment and subsequent use treatment and discharge or evaporation subject to compliance with state and federal regulations. Management of these waters is challenging not only for industry and regulators but also for landowners and the public because of differences in the quality and quantity of produced water, varying infrastructure needs, costs, and environmental considerations associated with produced water disposal, storage, and transport. Unconventional oil and gas development involves technologies that combine horizontal drilling with the practice of hydraulic fracturing. Hydraulic fracturing is a controlled high pressure injection of fluid and proppant into a well to generate fractures in the rock formation containing the oil or gas. After the hydraulic fracture procedure is completed, the injected fluid is allowed to flow back into the well, leaving the proppant in the newly created fractures. As a result, a portion of the injected water returns to the surface, and this water is called flowback water, which initially may mix with the naturally occurring produced water from the formation. The chemistry and volume of water returning to the surface from unconventional oil and gas operations thus changes during the lifetime of the well due to the amount of fluid used in the initial stage of well development, the amount of water naturally occurring in the geologic formation, the original water and rock chemistry, the type of hydrocarbon being produced, and the way in which production is conducted. The volume and composition of flowback and produced waters vary with geography, time, and site specific factors. A workshop was conducted by the National Academies of Sciences, Engineering, and Medicine to highlight the challenges and opportunities associated in managing produced water from unconventional hydrocarbon development and particularly in the area of potential beneficial uses for these waters. This publication summarizes the presentations and discussions from the workshop.

Analysis of Engineering Design Studies for Demilitarization of Assembled Chemical Weapons at Pueblo Chemical Depot National Research Council, Division on Engineering and Physical Sciences, Board on Army Science and Technology, Committee on Review and Evaluation of Alternative Technologies for Demilitarization of Assembled Chemical Weapons: Phase II, 2001-09-27 The Program Manager for Assembled Chemical Weapons Assessment (PMACWA) of the Department of Defense (DOD) requested the National Research Council (NRC) to assess the engineering design studies (EDSs) developed by Parsons Honeywell and General Atomics for a chemical demilitarization facility to completely dispose of the assembled chemical weapons at the Pueblo Chemical Depot in Pueblo, Colorado. To accomplish the task, the NRC formed the Committee on Review and Evaluation of Alternative Technologies for Demilitarization of Assembled Chemical Weapons (Phase II ACW II Committee). This report presents the results of the committee's scientific and technical assessment, which will assist the Office of the Secretary of Defense in selecting the technology package for destroying the chemical munitions at Pueblo. The committee evaluated the engineering design

packages proposed by the technology providers and the associated experimental studies that were performed to validate unproven unit operations A significant part of the testing program involved expanding the technology base for the hydrolysis of energetic materials associated with assembled weapons This process was a concern expressed by the Committee on Review and Evaluation of Alternative Technologies for Demilitarization of Assembled Chemical Weapons ACW I Committee in its original report in 1999 NRC 1999 The present study took place as the experimental studies were in progress In some cases tests for some of the supporting unit operations were not completed in time for the committee to incorporate results into its evaluation In those cases the committee identified and discussed potential problem areas in these operations Based on its expertise and its aggressive data gathering activities the committee was able to conduct a comprehensive review of the test data that had been completed for the overall system design This report summarizes the study *Review of Hydraulic Fracturing Technology and Practices* United States.
