Swarm Intelligence and Bio-Inspired Computation Raha Imanirad, Julian Scott Yeomans, 2013-05-16 In solving many practical mathematical programming applications it is generally preferable to formulate several quantifiably good alternatives that provide very different approaches to the particular problem This is because decision making typically involves complex problems that are riddled with incompatible performance objectives and possess competing design requirements which are very difficult if not impossible to quantify and capture at the time that the supporting decision models are constructed There are invariably unmodeled design issues not apparent at the time of model construction which can greatly impact the acceptability of the model's solutions Consequently it is preferable to generate several alternatives that provide multiple disparate perspectives to the problem These alternatives should possess near optimal objective measures with respect to all known modeled objective's but be fundamentally different from each other in terms of the system structures characterized by their decision variables This solution approach is referred to as modeling to generate alternatives MGA This chapter provides a synopsis of various MGA techniques and demonstrates how biologically inspired MGA algorithms are particularly efficient at creating multiple solution alternatives that both satisfy required system performance criteria and yet are maximally different in their decision spaces The efficacy and efficiency of these MGA methods are demonstrated using a number of case studies

Van Sciver,Ray Radebaugh,Michael DiPirro,J. Patrick Kelley,Klaus D. Timmerhaus,Jay Theilacker,Charles Reece,2013-12-19 In recent years the technology of cryogenic comminution has been widely applied in the field of chemical engineering food making medicine production and particularly in recycling of waste materials Because of the increasing pollution of waste tires and the shortage of raw rubber resource the recycling process for waste rubber products has become important and commercially viable This technology has shown a great number of advantages such as causing no environmental pollution requiring low energy consumption and producing high quality products Hence the normal crusher which was used to reclaim materials such as waste tires nylon plastic and many polymer materials at atmospheric 12 temperature is being replaced by a cryogenic crusher In the cryogenic crusher the property of the milled material is usually very sensitive to temperature change When a crusher is in operation it will generate a great deal of heat that causes the material temperature increased Once the temperature increases over the vitrification temperature the material property will change and lose the brittle behavior causing the energy consumption to rise sharply Consequently the comminution process cannot be continued Therefore it is believed that the cryogenic crusher is the most critical component in the cryogenic comminution system The research on the temperature increase and energy consumption in the cryogenic crusher is not only to reduce the energy consumption of the crasher but also to reduce the energy consumption of the cryogenic system **Research in Education** ,1972
