Objectives

- List two examples of ecological succession.
- Explain how a pioneer species contributes to ecological succession.
- Explain what happens during old-field succession.
- Describe how lichens contribute to primary succession.

Life Depends on the Sun

- Energy from the sun enters an ecosystem when plants use sunlight to make sugar molecules.
- This happens through a process called photosynthesis.
- Photosynthesis is the process by which plants, algae, and some bacteria use sunlight, carbon dioxide, and water to produce carbohydrates and oxygen.

From Producers to Consumers

- Because plants make their own food, they are called *producers*.
- A producer is an organism that can make organic molecules from inorganic molecules.
- Producers are also called autotrophs, or self-feeders.
- Organisms that get their energy by eating other organisms are called *consumers*.
- A consumer is an organism that eats other organisms or organic matter instead of producing its own nutrients or obtaining nutrients from inorganic sources.
- Consumers are also called heterotrophs, or other-feeders.
- Some producers get their energy directly from the sun by absorbing it through their leaves.
- Consumers get their energy indirectly by eating producers or other consumers.
