Protein Folding and Drug Design R.A. Broglia,L. Serrano,G. Tiana,2007-10-26 One of the great unsolved problems of science and also physics is the prediction of the three dimensional structure of a protein from its amino acid sequence the folding problem It may be stated that the deep connection existing between physics and protein folding is not so much or in any case not only through physical methods experimental X rays NMR etc or theoretical statistical mechanics spin glasses etc but through physical concepts In fact protein folding can be viewed as an emergent property not contained neither in the atoms forming the protein nor in the forces acting among them in a similar way as superconductivity emerges as an unexpected coherent phenomenon taking place on a sea of electrons at low temperature Already much is known about the

protein folding problem thanks among other things to protein engineering experiments as well as from a variety of theoretical inputs inverse folding problem funnel like energy landscapes Peter Wolynes helix coil transitions etc Although quite different in appearance the fact that the variety of models can account for much of the experimental findings is likely due to the fact that they contain much of the same right physics A physics which is related to the important role played by selected highly conserved hot amino acids which participate to the stability of independent folding units which upon docking give rise to a post critical folding nucleus lying beyond the highest maximum of the free energy associated to the process
