

Chapter 39 Endocrine and Reproductive Systems**Summary****39-1 The Endocrine System**

A gland is an organ that makes and releases a secretion. **Exocrine glands** release their secretions through ducts directly to the organs that use them. **Endocrine glands** release hormones into the bloodstream. **The endocrine system is made up of endocrine glands.**

Hormones are chemicals made in one part of the body that affect cells elsewhere in the body. Hormones bind to target cells. **Target cells** are specific chemical receptors on cells.

There are two types of hormones: steroid hormones and nonsteroid hormones. Steroid hormones can cross cell membranes of target cells, enter the nucleus, and turn genes on or off. Nonsteroid hormones cannot cross cell membranes. Compounds called secondary messengers carry the messages of nonsteroid hormones inside target cells.

All cells, except for red blood cells, produce hormonelike substances called prostaglandins. Prostaglandins usually affect only nearby cells and tissues. They are known as “local hormones.”

The endocrine system is controlled by feedback mechanisms that help maintain homeostasis. For example, the level of a hormone in the blood may be the feedback that signals a gland to make more or less of the hormone. Two hormones with opposite effects may work together to maintain homeostasis. This is called complementary hormone action.

39-2 Human Endocrine Glands

There are several endocrine glands scattered throughout the body.

- The **pituitary gland** secretes nine hormones that regulate body functions and control the actions of other endocrine glands.
- Hormones from the **hypothalamus** control the secretions of the pituitary gland.
- Hormones from the **thyroid gland** regulate metabolism.
- Hormones from the thyroid gland and **parathyroid glands** maintain blood calcium levels.
- The **adrenal glands** make hormones that help the body prepare for and deal with stress.
- The **pancreas** is both an exocrine gland and an endocrine gland. Hormones produced in the pancreas help keep levels of glucose in the blood stable.
- **Reproductive glands**, or gonads, make gametes and secrete sex hormones. The female gonads, **ovaries**, produce eggs. The male gonads, **testes**, produce sperm.
