Physics in Oxford, 1839-1939 Robert Fox, Graeme Gooday, 2005-06-16

Physics in Oxford 1839 1939 offers a challenging new interpretation of pre war physics at the University of Oxford which was far more dynamic than most historians and physicists have been prepared to believe It explains on the one hand how attempts to develop the University's Clarendon Laboratory by Robert Clifton Professor of Experimental Philosophy from 1865 to 1915 were thwarted by academic politics and funding problems and latterly by Clifton's idiosyncratic concern with precision instrumentation Conversely by examining in detail the work of college fellows and their laboratories the book reconstructs the decentralized environment that allowed physics to enter on a period of conspicuous vigour in the late nineteenth and early twentieth centuries especially at the characteristically Oxonian intersections between physics physical chemistry mechanics and mathematics Whereas histories of Cambridge physics have tended to focus on the self sustaining culture of the Cavendish Laboratory it was Oxford's college trained physicists who enabled the discipline to flourish in due course in university as well as college facilities notably under the newly appointed professors J S E Townsend from 1900 and F A Lindemann from 1919 This broader perspective allows us to understand better the vitality with which physicists in Oxford responded to the demands of wartime research on radar and techniques relevant to atomic weapons and laid the foundations for the dramatic post war expansion in teaching and research that has endowed Oxford with one of the largest and most dynamic schools of physics in the world

Representations of Nature of Science in School Science Textbooks Christine V. McDonald, Fouad Abd-El-Khalick, 2017-04-21 Bringing together international research on nature of science NOS representations in science textbooks the unique analyses presented in this volume provides a global perspective on NOS from elementary to college level and discusses the practical implications in various regions across the globe Contributing authors highlight the similarities and differences in NOS representations and provide recommendations for future science textbooks This comprehensive analysis is a definitive reference work for the field of science education **Liverpool** Joseph Sharples, Richard Pollard, 2004-01-01 Guidebook to significant and interesting architectural sites in Liverpool **Hidden Worlds in Quantum Physics** Gerard Gouesbet, 2014-01-15 With its emphasis on the history and philosophical foundations of physics this book will interest lay readers as well as students and professionals The distinguished author discusses pioneers in the field including Pauli Einstein Bohr and de Broglie Topics include hidden variable and causal theories pilot wave and Schrödinger's equation 2013 edition *Electronic Dissipation Processes During Chemical Reactions on Surfaces* Kevin Stella, 2011 Every day in our life is larded with a huge number of chemical reactions on surfaces Some reactions occur immediately for others an activation energy has to be supplied Thus it happens that though a reaction should thermodynamically run off it is kinetically hindered Meaning the partners react only to the thermodynamically more stable product state within a mentionable time if the activation energy of the reaction is supplied With the help of catalysts the activation energy of a reaction can be lowered Such catalytic processes on surfaces are widely used in industry Around 90% of chemicals are produced via a heterogeneously catalyzed process where a reaction occurs on the surface of a catalyst However why is it generally possible that such reactions run off with the help of heterogeneous catalysis meaning with lower activation energy than without presence of a catalyst What happens with the energy which is released during a reaction of gas particles on surfaces How is this energy released when some part of the energy is transferred to the reactant and some to the chemically active surface Which physical mechanisms play a key role in the energy transfer These questions are summarized in the concept of the energy dissipation To observe this energy dissipation phenomenon we use a new method the chemoelectronics With this method we try to detect the released energy induced by reactions on surfaces via thin layered electronic device elements An aim of this work is to build up very sensitive chemoelectronic sensors to measure electronic excitations released during such simple reactions of molecules as adsorption and desorption and more complicated reactions as the water formation reaction Therefore a new line of chemoelectronic sensors is developed and characterized in terms of internal photoemission and stability Meaning the previously used aluminum Al AlOx Ag and tantalum based Ta TaOx Au metal insulator metal sensors MIM are tested and new titanium based Ti TiOx Au MIMs are developed Additionally silicon

based stepped metal insulator semiconductor sensors stepped MIS Si SiO_x Au Si SiO_x Pt are set up and characterized For the characterization of the chemoelectronic sensors the process of internal photoemission is used Both chemical and photoexcitation release hot charge carriers electrons and holes Due to the existence of excited carriers in the sensor a current can be measured without applying a bias voltage It will be shown that the chemo and the photosensitivity are strongly related to each other As a first experiment for the chemical selectivity of the detectors a stream of excited hydrogen molecules and hydrogen atoms is used The excitation and radical formation is produced by the interaction of ground state molecules with a hot tungsten surface according to the pioneering experiments of Irving Langmuir Additionally excited oxygen beams are studied in this work
