How do scientists know how old a fossil is?

Scientists divide Earth's past into blocks of time, or **periods**, that are millions of years long. During each period, certain kinds of plants and animals lived. Not every plant or animal becomes a fossil, but enough did that scientists are able to draw conclusions about what lived during which period. The timeline below shows some of the periods in Earth's history.

Write true or false.

- Reptile fossils are older than bird fossils.
- Humans and dinosaurs lived during the same time.
- The newest fossils are from ocean creatures.
- Fish appeared on Earth after mammals did.

Weekly Question

Day 3

How do scientists know how old a fossil is?

Whenever a scientist finds a new or unfamiliar fossil, he or she will look at a **marker fossil** for clues about the age of the unfamiliar fossil. For example, **trilobites** are marker fossils. These extinct insects lived in oceans and were so common 250 to 500 million years ago that there are more trilobite fossils than fossils of other creatures. So they serve as "markers" of the time period they are found. If a scientist finds a new kind of fossil in the same rock as a trilobite fossil, the scientist can figure out when the unfamiliar plant or animal lived.

A. Write the word that completes each sentence.

- Trilobites lived 300 _____ years ago.
thousand million billion
- A marker fossil can help scientists figure out another fossil's _____.

- A trilobite was an animal that lived in the _____.

B. Since trilobites were so common in the past, they made many fossils. What creature living today might make a lot of fossils, like the trilobite did? Explain your answer.
