Baylis, 2012-12-06 The advent of relatively inexpensive but powerful computers is affecting practically all aspects of our lives but some of the greatest influence is being felt in the physical sciences However university curricula and teaching methods have responded somewhat cautiously having only recently come to terms with the now

omnipresent calculator While many instructors at first feared that the widespread use of pocket calculators would lead to generations of students who could not multiply or perhaps even add few now seriously lament the disappearance of slide rules logarithm tables and the often error bound tedium that such tools of the trade demand Time that used to be spent on the use of logarithm tables and manual square root extraction can be profitably turned to earlier studies of calculus or computer programming Now that the calculator has been accepted into the classroom we face a computer software revolution which promises to be considerably more profound Modern textbooks in the physical sciences routinely assume their readers have access not only to calculators but often to home or even mainframe computers as well and the problems teachers discuss and assign students can be more complex and often more realistic than in the days of only pad and pencil computations As less effort is spent on numerical computation more can be devoted to conceptual understanding and to applications of the increasingly sophisticated mathematical methods needed for a real appreciation of recent advances in the discipline

Designing Learning Environments for Developing Understanding of Geometry and Space Richard Lehrer, Daniel Chazan, 2012-11-12 This volume reflects an appreciation of the interactive roles of subject matter teacher student and technologies in designing classrooms that promote understanding of geometry and space Although these elements of geometry education are mutually constituted the book is organized to highlight first the editors vision of a general geometry education second the development of student thinking in everyday and classroom contexts and third the role of technologies Rather than looking to high school geometry as the locus and all too often the apex of geometric reasoning the contributors to this volume suggest that reasoning about space can and should be successfully integrated with other forms of mathematics starting at the elementary level and continuing through high school Reintegrating spatial reasoning into the mathematical mainstream indeed placing it at the core of K 12 mathematics environments that promote learning with understanding will mean increased attention to problems in modeling structure and design and reinvigoration of traditional topics such as measure dimension and form Further the editors position is that the teaching of geometry and spatial visualization in school should not be compressed into a characterization of Greek geometry but should include attention to contributions to the mathematics of space that developed subsequent to those of the Greeks This volume is essential reading for those involved in mathematics education at all levels including university faculty researchers and graduate students
