*Handbook of Digital Forensics of Multimedia Data and Devices, Enhanced E-Book* Anthony T. S. Ho, Shujun Li, 2016-05-20 Digital forensics and multimedia forensics are rapidly growing disciplines whereby electronic information is extracted and interpreted for use in a court of law. These two fields are finding increasing importance in law enforcement and the investigation of cybercrime as the ubiquity of personal computing and the internet becomes ever more apparent. Digital forensics involves investigating computer systems and digital artefacts in general while multimedia forensics is a sub topic of digital forensics focusing on evidence extracted from both normal computer systems and special multimedia devices such as digital cameras. This book focuses on the interface between digital forensics and multimedia forensics bringing two closely related fields of forensic expertise together to identify and understand the current state of the art in digital forensic investigation. Both fields are expertly attended to by contributions from researchers and forensic practitioners specializing in diverse topics such as forensic authentication, forensic triage, forensic photogrammetry, biometric forensics, multimedia device identification and image forgery detection among many others. Key features: Brings digital and multimedia forensics together with contributions from academia, law enforcement and the digital forensics industry for extensive coverage of all the major aspects of digital forensics of multimedia data and devices. Provides comprehensive and authoritative coverage of digital forensics of multimedia data and devices. Offers not only explanations of techniques but also real world and simulated case studies to illustrate how digital and multimedia forensics techniques work. Includes a companion website hosting continually updated supplementary materials ranging from extended and updated coverage of standards to best practice guides, test datasets and more case studies.

Microbial Safety in Water Resources Pei-Ying Hong, Timothy R. Julian, Muhammad Raihan Jumat, 2019-02-19 As more countries become water scarce, alternative water sources like treated wastewaters will be used to meet the demands of the domestic agriculture and industrial sectors. However, the use of treated wastewater is only justified when it is without any detrimental impacts on public health, food safety and water quality. To minimize impacts, well operated treatment plants are important barriers that reduce the amount of contaminants disseminated from wastewaters into the environment during reuse events. Continuous, accurate and comprehensive monitoring on our water further safeguards the public against potential risks. This eBook looks into topics that close the knowledge gaps in these mentioned areas.

Inspection Bodies and comparison with Israeli s regulations for investment portfolio management Manufacturers in the modern commerce world have understood that in order to succeed in a competitive global market they have to comply with the customer s expectations while observing a continuous improvement of the production processes or the service and the reduction of costs This global orientation was taking shape the development of quality management approaches that accentuated the quality of production processes and quality management issues In the last decade international standards in the quality management field were published with the aim to provide the customer a trust in the supplier s organization The quality standardization formation accentuated the issue of services rendered to the customer those which he could not examine and inspect by comparing to benchmark results or by comparing between different suppliers for example compliance with reliability requirements or laboratory s test results For this type of services international standards that were more meticulous were developed referring to the organization s form of management and its professional capabilities which included the level of workforce instrumentation and environmental conditions Two concepts were developed in order to discriminate between fields that only included the organizational management system and those that also required proof of professional capabilities Certification and Accreditation Certification refers to demands from the management organizational framework In order to acquire certification the existence and maintain of a compatible quality system is inspected Accreditation refers to demands from the quality system and in addition the proof of professional capabilities of the organization and its employees The accreditation is given to laboratories to bodies that grant certification to organizations that supply products and services to bodies that certificate the professional level of personnel to bodies that confirm organizations standing up to environmental safety and health requirements and to bodies that carry out inspections In order that organizations in a country will be able to prove their compatibility with the international standards the country should develop an infrastructure that includes a National Accreditation Body NAB This body will accredit the certification bodies operating in the country The certification bodies should be a third party that will inspect certain requirements from various organizations As an example a certification body for manufacturing and service industries audits compliance to ISO 9001 Several certification bodies for this purpose operate in Israel Certification Department at the Standards Institution of Israel SII RNET ICS Ltd IQC DNV Technion R D Ltd GESCO Ltd SKAL A customer that approaches a supplier that received certification from a certification body that has been accredited by a NAB can trust the supplier s quality management system Nevertheless the customer should check if he is receiving a product or service that complies with the specifications agreed with the supplier The NAB accredits all kind of certification bodies and laboratories according to the appropriate requirements The NAB operates according to ISO 17011 Companies that provide inspection services should comply with ISO 17020 2012 The Inspection body performs inspections according to the requirements in a validated reference document that has been agreed upon with its customer or that is mandated by local regulations The accredited inspected body has the right

to grant a certification to the inspected customer's site or project. In 1995, EN 45004 was published and included the requirements for imparting trust in an organization that performs an inspection; it replaced the previous ISO Guide 39:1988. Nevertheless, in that period, the discrimination between accreditation and certification had not yet been determined, and the term Acceptance was in use. In 1998, on determining the discrimination and the determination that the inspection bodies will also undergo accreditation, the ISO 17010:1998 was developed. This standard is influenced by EN 45003:1995 or its equivalent ISO Guide 58:1993, which refers to the accreditation body operating for laboratories, and also by ISO Guide 61:1996, which refers to the accreditation body for certification bodies. The process of accreditation, i.e. if the inspection of management system processes and employees' professionalism complies with requirements, has received the term Conformity Assessment. The ISO committee that dealt with this issue, CASCO, has prepared several guiding documents. The tools of the conformity inspection according to the historical sequence of those documents are an inspection, an examination, an audit, a certification, and an accreditation. These tools can serve first and second parties, regulators, and everybody else that presents requirements for conformity. The segmentation concerning the capability of applying the tools is shown in Table 1, where the NAB is indicated as third body. Tools for the assessment of conformity: I Party, Party II, Party III, Producer's declaration, Inspection, Testing, Auditing, Certification, Accreditation. Table 1 applies tools for conformity assessment. As can be seen, each one of the parties can conduct an examination, an inspection, and an audit. The field of inspection services is very broad and touches a wide variety of services. For example, an inspection of maintenance activities, conformity to requirements, and supervision in a building site, evaluation of companies' assets, financial statement, periodic inspection of elevators, supervising fire extension systems, and other safety devices, schools, surveillance, supervising measurement performance, etc. The requirements for accreditation and for not settling only for the certification of inspection bodies stem from the fact that it is difficult to install trust in an inspection that has been carried out, as it is impossible to verify it by carrying it out by performing a second time under the same conditions and with the same inspection body or with another one. This is the reason underlying the decision that an inspection body should stand up to an accreditation similar to testing and calibration laboratories, as it strongly depends on the performers' professionalism. In light of the requirements and partial interpretations published so far, the difference between an inspection body and a testing/calibration laboratory is not quite clear. So far, part of the inspecting work has only been carried out by laboratories. ISO 17020 relates to activities of bodies whose tasks may include inspection of materials, products, facilities, plants, work processes, service operations, and decisions on the level of conformity with defined requirements. The inspection usually relates to all the life cycle of items, including the steps of design and recycling or disposal. The results of the inspection are reported to the customers, and whenever law requires, the inspection results will be reported also to the relevant authorities. The definition of inspection according to ISO 17020 involves professional judgment for conformity assessment, and this concept has serious implications on the qualification of the

inspectors employed by the inspection body The range of the activity of inspection services covers a very wide human activities such as conformity inspection of items to defined requirements inspection in construction sites inspection of financial balances inspection of elevators fire extinguishing systems and other safety systems inspection of education levels inspection of geodetic measurements It was decided that inspection body would be accredited as required by testing and calibration laboratories and certification bodies The aim of the present work was to understand the ISO 17020 requirements and its implications the standard uniqueness and the meaning for laboratories that previously preformed inspection within the frame of the accreditation scope for testing In part one the study the following aspects were considered a The approaches for inspection at different sectors the definitions used previously at the ISO standards the approach of the European Union to inspection interpretations of national bodies and the meaning of inspection in ISO 9001 The huge volume of experience gained with inspection in the different sectors served as the basis for the understanding that inspection findings and results should be interpreted relying on professional judgment and employment of suitable professional inspectors who can cope with the examined subject They should have the knowledge to understand the effect of deviations and be able to report the inspection results including a clear statement on conformity to defined and accepted criteria All this accumulated experience contributed to the development of ISO 17020 b The interpretation of the ISO 17020 requirements according to the European understanding analysis was performed of the standard in light of the European interpretations EAL G24 The analysis pointed at three major innovations Novel definition of inspection Novel criteria for independence of the inspection body Suitability of the inspection method to the inspected item c Comparison between the requirements from a testing laboratory and from an inspection body up to present testing laboratories performed some of the inspection activities Analysis of ISO 17020 articles in comparison with ISO Guide 25 That was Replaced to ISO 17025 the requirements from laboratories was performed d The differences identified by us are essential A laboratory that used to perform both inspection and testing activities will have to be redefined as an entity that includes a laboratory and an inspection body The laboratory shall comply with ISO 17025 and the inspection body with ISO 17020 The second part of the study The Law for the Regulation of Investment Advice Investment Marketing and Investment Management 1995 Investment Advice Law regulates the investment advice and portfolio management industries in Israel The law is primarily a consumer protection law the primary of objective of which is to set industry standards of professionalism good conduct and accountability for individuals and firms engaged in providing advisory and portfolio management services In addition to establishing threshold requirements for entering the profession the Law addresses issues such as mitigating conflicts of interest between financial intermediaries and clients the necessity of tailoring services to the individual needs of the investor and the marketing of financial instruments to retail customers The Law also establishes know your customer procedures and sets clear requirements for the disclosure of service fees and for the prevention of directed brokerage activities The Investment Advice Law regulates the licensing and supervision of
