*Integer Programming and Combinatorial Optimization* Michel Goemans, José Correa, 2013-03-12 This book constitutes the proceedings of the 16th International Conference on Integer Programming and Combinatorial Optimization IPCO 2013 held in Valparaíso Chile in March 2013 The 33 full papers presented were carefully reviewed and selected from 98 submissions The conference is a forum for researchers and practitioners working on various aspects of integer programming and combinatorial optimization with the aim to present recent developments in theory computation and applications The scope of IPCO is viewed in a broad sense to include algorithmic and structural results in integer programming and combinatorial optimization as well as revealing computational studies and novel applications of discrete optimization to practical problems

**Basic Matrix Algebra with Algorithms and Applications** Robert A. Liebler, 2018-10-03 Clear prose tight organization and a wealth of examples and computational techniques make Basic Matrix Algebra with Algorithms and Applications an outstanding introduction to linear algebra The author designed this treatment specifically for freshman majors in mathematical subjects and upper level students in natural resources the social sciences business or any discipline that eventually requires an understanding of linear models With extreme pedagogical clarity that avoids abstraction wherever possible the author emphasizes minimal polynomials and their computation using a Krylov algorithm The presentation is highly visual and relies heavily on work with a graphing calculator to allow readers to focus on concepts and techniques rather than on tedious arithmetic Supporting materials including test preparation Maple worksheets are available for download from the Internet This unassuming but insightful and remarkably original treatment is organized into bite sized clearly stated objectives It goes well beyond the LACSG recommendations for a first course while still implementing their philosophy and core material Classroom tested with great success it prepares readers well for the more advanced studies their fields ultimately will require

*Functional Equations and How to Solve Them* Christopher G. Small, 2007-04-03 Over the years a number of books have been written on the theory of functional equations However very little has been published which helps readers to solve functional equations in mathematics competitions and mathematical problem solving This book fills that gap The student who encounters a functional equation on a mathematics contest will need to investigate solutions to the equation by finding all solutions or by showing that all solutions have a particular property The emphasis here will be on the development of those tools which are most useful in assigning a family of solutions to each functional equation in explicit form At the end of each chapter readers will find a list of problems associated with the material in that chapter The problems vary greatly with the easiest problems being accessible to any high school student who has read the chapter carefully The most difficult problems will be a reasonable challenge to advanced students studying for the International Mathematical Olympiad at the high school level or the William Lowell Putnam Competition for university undergraduates The book ends with an appendix containing topics that provide a springboard for further investigation of the concepts of limits infinite series

**Lectures on Differential Equations** Philip L. Korman, 2019-08-30 Lectures on Differential Equations provides a clear and concise presentation of differential equations for undergraduates and beginning graduate students There is more than enough material here for a year long course In fact the text developed from the author's notes for three courses the undergraduate introduction to ordinary differential equations the undergraduate course in Fourier analysis and partial differential equations and a first graduate course in differential equations The first four chapters cover the classical syllabus for the undergraduate ODE course leavened by a modern awareness of computing and qualitative methods The next two chapters contain a well developed exposition of linear and nonlinear systems with a similarly fresh approach The final two chapters cover boundary value problems Fourier analysis and the elementary theory of PDEs The

author makes a concerted effort to use plain language and to always start from a simple example or application. The presentation should appeal to and be readable by students especially students in engineering and science. Without being excessively theoretical, the book does address a number of unusual topics: Massera's theorem, Lyapunov's inequality, the isoperimetric inequality, numerical solutions of nonlinear boundary value problems, and more. There are also some new approaches to standard topics including a rethought presentation of series solutions and a nonstandard but more intuitive proof of the existence and uniqueness theorem. The collection of problems is especially rich and contains many very challenging exercises.

Philip Korman is professor of mathematics at the University of Cincinnati. He is the author of over one hundred research articles in differential equations and the monograph *Global Solution Curves for Semilinear Elliptic Equations*. Korman has served on the editorial boards of *Communications on Applied Nonlinear Analysis*, *Electronic Journal of Differential Equations*, *SIAM Review*, and *Differential Equations and Applications*.
