Encyclopedia of Mathematical Geosciences B. S. Daya Sagar, Qiuming Cheng, Jennifer McKinley, Frits Agterberg, 2023-07-13 The Encyclopedia of Mathematical Geosciences is a complete and authoritative reference work. It provides concise explanation on each term that is related to Mathematical Geosciences. Over 300 international scientists, each expert in their specialties, have written around 350 separate articles on different topics of mathematical geosciences, including contributions on Artificial Intelligence, Big Data, Compositional Data Analysis, Geomathematics, Geostatistics, Geographical Information Science, Mathematical Morphology, Mathematical Petrology, Multifractals, Multiple Point Statistics, Spatial Data Science, Spatial Statistics, and Stochastic Process Modeling. Each topic incorporates cross referencing to related articles and also has its own reference list to lead the reader to essential articles within the published literature. The entries are arranged alphabetically for easy access, and the subject and author indices are comprehensive and extensive.

Explorations of Mathematical Models in Biology with MATLAB Mazen Shahin, 2013-12-24 Explore and analyze the solutions of mathematical models from diverse disciplines. As biology increasingly depends on data algorithms and models, it has become necessary to use a computing language such as the user-friendly MATLAB to focus more on building and analyzing models as opposed to configuring tedious calculations. *Explorations of Mathematical Models in Biology with MATLAB* provides an introduction to model creation using MATLAB, followed by the translation, analysis, interpretation, and observation of the models. With an integrated and interdisciplinary approach that embeds mathematical modeling into biological applications, the book illustrates numerous applications of mathematical techniques within biology, ecology, and environmental sciences. Featuring a quantitative computational and mathematical approach, the book includes examples of real-world applications such as population dynamics, genetics, drug administration, interacting species, and the spread of contagious diseases to showcase the relevancy and wide applicability of abstract mathematical techniques. Discussion of various mathematical concepts such as Markov chains, matrix algebra, eigenvalues, eigenvectors, first-order linear difference equations, and nonlinear first-order difference equations. Coverage of difference equations to model a wide range of real-life discrete time situations in diverse areas, as well as discussions on matrices to model linear problems. Solutions to selected exercises and additional MATLAB codes. *Explorations of Mathematical Models in Biology with MATLAB* is an ideal textbook for upper undergraduate courses in mathematical models in biology, theoretical ecology, bioeconomics, forensic science, applied mathematics, and environmental science. The book is also an excellent reference for biologists, ecologists, mathematicians, biomathematicians, and environmental and resource economists. [Linear Algebra and Its Applications](#) David C. Lay, 1994 Linear algebra is relatively easy for students during the early stages of the course when the material is presented in a familiar concrete setting. But when abstract concepts are introduced, students often hit a brick wall. Instructors seem to agree that certain concepts such as linear independence, spanning subspace, vector space, and linear transformations

are not easily understood and require time to assimilate Since they are fundamental to the study of linear algebra students understanding of these concepts is vital to their mastery of the subject Lay introduces these concepts early in a familiar concrete \mathbb{R}^n setting develops them gradually and returns to them again and again throughout the text so that when discussed in the abstract these concepts are more accessible
