RUNX Proteins in Development and Cancer Yoram Groner, Yoshiaki Ito, Paul Liu, James C. Neil, Nancy A. Speck, Andre van Wijnen, 2017-03-15 This volume provides the reader with an overview of the diverse functions of the RUNX family of genes As highlighted in the introduction and several of the 29 chapters humans and other mammals have three RUNX genes that are known to play specific roles in blood bone and neuronal development However their evolutionary history has recently been traced back to unicellular organisms and their involvement in many well known signaling pathways Wnt TGFb Notch Hippo is indicative of a more general function in cell biology Their documented roles in cell fate decisions include control of proliferation differentiation survival senescence and autophagy The pleiotropic effects of RUNX in development are mirrored in cancer where RUNX genes can function as oncogenes that collaborate strongly with Myc family oncogenes or as tumour suppressor genes In the latter role they display hallmarks of both gatekeepers that modulate p53 responses and caretakers that protect the genome from DNA damage Several chapters focus on the importance of these genes in leukemia research where RUNX1 and CBFb are frequently affected by chromosomal translocations that generate fusion oncoproteins while

recent studies suggest wider roles for RUNX modulation in solid cancers Moreover RUNX genes are intimately involved in the development and regulation of the immune system while emerging evidence suggests a role in innate immunity to infectious agents including HIV At the biochemical level the RUNX family can serve as activators or repressors of transcription and as stable mediators of epigenetic memory through mitosis Not surprisingly RUNX activity is controlled at multiple levels this includes miRNAs and a plethora of post translational modifications Several chapters highlight the interplay between the three mammalian RUNX genes where cross talk and partial functional redundancies are evident Finally structural analysis of the RUNX CBFB interaction has led to the development of small molecule inhibitors that provide exciting new tools to decipher the roles of RUNX in development and as targets for therapy This volume provides a compendium and reference source that will be of broad interest to cancer researchers developmental biologists and immunologists

Animal Models for the Study of Human Disease Peter Fickert,Marion J. Pollheimer,Christoph H. Österreicher,Michael Trauner,2013-05-29 Cholestatic liver diseases such as primary sclerosing

cholangitis, PSC and primary biliary cirrhosis (PBC) represent an important group of liver diseases of the intra and extrahepatic bile ducts frequently causing end stage liver disease with significant morbidity and mortality due to limited treatment options. The limitations of the currently available medical therapy largely reflect our deficits in understanding the pathophysiology of cholestatic liver diseases. Therefore, there is an urgent need for reliable, well defined and easily reproducible animal models to gain insights into the PSC and PBC pathophysiology and to test novel treatment modalities. We aimed to provide a systematic overview of currently available animal models for sclerosing cholangitis and biliary fibrosis and critically discuss the characteristics of rodent models for PSC and PBC, models of experimental biliary obstruction, models of inflammation induced cholestasis as well as models of inherited cholestatic syndromes.
