As mentioned previously, the results of the study are striking, but there are some caveats. First, the sample is not representative of the general population. The study was conducted in a single institution, and the participants were all students. This limits the generalizability of the findings. Second, the study was a cross-sectional design, which means that we cannot establish a causal relationship between the variables. Finally, the study did not control for other factors that might influence the results, such as age, gender, and socioeconomic status. Despite these limitations, the study provides valuable insights into the relationship between social media use and mental health.
