Physico-Chemical Control of Cell Function Cesare Gargioli, Giancarlo Forte, Alberto Raineri, 2019-10-17 Extracellular Matrix (ECM) has been considered for a long time merely a scaffold sustaining cell and tissue function Despite this simplistic view shared by many nowadays ECM and their mechanical physical and chemical characteristics acquired a progressively larger role actively regulating cell life survival proliferation gene expression and differentiation The interplay between cells and the ECM is continuously controlled at the cell level in a dynamic way While cells synthesize the raw components of the ECM this in turn impacts on cell function by providing chemical topographical and mechanical hints Such stimuli have been proven to control several aspects of cell function including survival proliferation differentiation and migration The molecular pathways activated by cells in response to the physical cues arising from the ECM are being disclosed and thus the possibility to control cell function through materials design is becoming more realistic Current in vitro protocols relying in 2D cell culture systems entail reductionist approaches to the complexity of cell ECM interaction and result in cells rapidly losing their distinctive functions in culture Understanding and replicating the 3D microenvironmental cues affecting cell function appears as a mandatory requirement for the development of next generation biomaterials as well as for the establishment of more physiologically relevant and predictive in vitro models of diseases Such an effort will require a multidisciplinary approach at the convergence of biophysics biology nanotechnology and bioengineering

Chemical Engineering, 1984 **Ocular Biomechanics in Health and Pathophysiology** Matthew A. Reilly, Jonathan Vande Geest, J. Crawford Downs, 2024-06-13 Biomechanical mechanisms may contribute to a large number of visual processes and pathologies including glaucoma keratoconus refractive surgery accommodation presbyopia myopia hyperopia trauma retinal detachment ocular development vitreous substitution cataract surgery corneal transplant and many others Departures from homeostatic loading may drive a large number of these processes in ways we are only beginning to recognize This Research Topic will explore how ocular biomechanics contribute to both the homeostasis and pathophysiology of the eye and visual system It is generally unknown whether changes in load drive changes in biomechanical properties or vice versa Clarifying driving forces for disease and elucidating the pathophysiologic response will ultimately enable the development of targeted treatments for many ocular and visual diseases for which biomechanics plays a role
