

a system continuously conditioned inside the house. By analyzing the heat and air flow, we learn what heat transfer (see Ch. 10) occurs between the house and its hot summer days. A thermodynamic analysis will tell us the conditions needed to maintain the temperature and relative humidity, and that moisture will tell us the size of the fan required to push the air in, out, and back in to distribute the cooled air throughout.

Perhaps we want to focus on the air conditioner itself. Figure 1.2 is a schematic of two heat exchangers, a compressor, and a valve. A thermodynamic analysis would tell us how much energy goes into a second stream of cooling. A heat transfer analysis would tell us the heat exchangers. The fluid dynamics analysis would tell us the cooling the compressor does for, as well as the needed compressor flow.

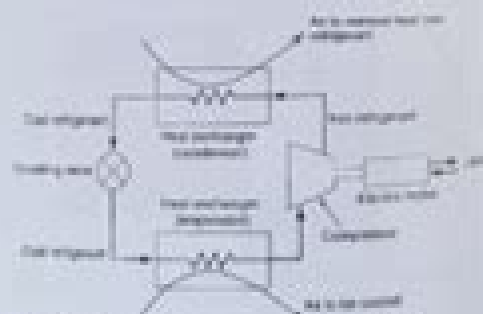

FIGURE 1.2 Schematic of vapor-compression refrigeration cycle.

FIGURE 1.3 Schematic of a building with multiple rooms.

It is a simple task, consider a cooling system used in a computer (Figure 1.4). The computer chips and power supply must be cooled so that the reliability of the system is not compromised. One common cooling approach is to force air through the computer case to remove unwanted heat. A thermodynamic analysis of such this cooling system and compressor would tell us the amount of energy that could be removed from inside the computer case so that the temperature of the air entering the electronic components will not exceed a given limit. That transfer analysis will tell us what heat sink design, fan, or other cooling strategies are needed to maintain the components at a safe temperature. Fluid dynamics will tell us the fan size needed to force air through an air filter and then for air over all the components and out of the computer case.

1.2 THERMAL AND FLUID SYSTEMS ANALYSIS AND ENGINEERING

Additional disciplines, similar to those given in the previous section, can be given all major subfields (e.g., power plants, oil refineries, chemical processing plants) and related processes (e.g., heat treatment of metals). Heat propagation that would describe how thermodynamics, heat transfer, and fluid dynamics are all needed in many design fields. It is the integrated use of these three disciplines that is required for thermal and systems analysis of many systems.

Whether the engineer is given an assignment to design a new device or modification to an existing process or to predict the performance of a device, the objectives of the design process must be very clear. Subsystems, which aspects of the device, process, or system in which to focus must be well defined. A systematic approach to the whole analysis is needed. Figure 1.5 shows a flow diagram of the design process typically take when analyzing and engineering a thermal fluid system. We always begin with the physical system (e.g., the engine of a car). This is reality. The engineer's job is, first, to translate the physical system into a physical model and, second, to describe the physical model with a mathematical model. The actual physical system may be so complex that it is impossible to fully describe each part within process. However, we require that device as needed, a solution, or better that we understand and recognize its design by the system sufficiently so that it can be modeled. Once a physical model is developed, then physical laws that govern the process (e.g., a flow, momentum, mass, or energy balance) are used to create the
