Parallel Algorithms and Architectures for DSP Applications Magdy A. Bayoumi,2012-12-06 Over the past few years the demand for high speed Digital Signal Proces sing DSP has increased dramatically New applications in real time image processing satellite communications radar signal processing pattern recogni tion and real time signal detection and estimation require major improvements at several levels algorithmic architectural and implementation These perfor mance requirements can be achieved by employing parallel processing at all levels Very Large Scale Integration VLSI technology supports and provides a good avenue for parallelism Parallelism offers efficient sohitions to several problems which can arise in VLSI DSP architectures such as 1 Intermediate data communication and routing several DSP algorithms such as FFT

involve excessive data routing and reordering Parallelism is an efficient mechanism to minimize the silicon cost and speed up the pro cessing time of the intermediate middle stages 2 Complex DSP applications the required computation is almost doubled Parallelism will allow two similar channels processing at the same time The communication between the two channels has to be minimized 3 Applicatilm specific systems this emerging approach should achieve real time performance in a cost effective way 4 Testability and fault tolerance reliability has become a required feature in most of DSP systems To achieve such property the involved time overhead is significant Parallelism may be the solution to maintain ac ceptable speed performance **Microelectronic Systems N2 Checkbook** R E Vears,2013-10-22 Microelectronic Systems N2 Checkbook provides coverage of the Business and Technician Education Council level NII unit in Microelectronic Systems However it can be regarded as a textbook in microelectronic systems for a much wider range of studies The aim of this book is to provide a foundation in microelectronic systems hardware and software techniques Each topic considered in the text is presented in a way that assumes in the reader only the knowledge attained in BTEC Information Technology Studies F Engineering Fundamentals F or equivalent This book concentrates on the highly popular 6502 Z80 and 6800 microprocessors and contains approximately 80 tested programs that may be used with little or no modification on most systems based on these microprocessors The text includes over 140 worked problems followed by some 250 further problems Additional material on the basic ideas of systems logic functions and numbering systems is included for the sake of completeness This book is designed for students seeking technician or equivalent qualification through the courses of the Business and Technician Education Council BTEC Scottish Technical Education Council Australian Technical and Further Education Departments East and West African Examinations Council and other comparable examining authorities in technical subjects **Handbook of Information Technology and Office Systems** A. Tzafestas,J.K. Pal,2012-12-06 The introduction of the microprocessor in computer and system engineering has motivated the development of many new concepts and has simplified the design of many modern industrial systems During the first decade of their life microprocessors have shown a tremendous evolution in all possible directions technology power functionality I O handling etc Of course putting the microprocessors and their environmental devices into properly operating systems is a complex and difficult task requiring high skills for melding and integrating hardware and systemic components software This book was motivated by the editors feeling that a cohesive reference is needed providing a good coverage of modern industrial applications of microprocessor based real time control together with latest advanced methodological issues Unavoidably a single volume cannot be exhaustive but the present book contains a sufficient number of important real time applications The book is divided in two sections Section I deals with general hardware software and systemic topics and involves six chapters

Chapter 1 by Gupta and Toong presents an overview of the development of microprocessors during their first twelve years of existence Chapter 2 by Dasgupta deals with a number of system software concepts for real time microprocessor based systems task scheduling memory management input output aspects programming language reqUirements **VLSI and Computer Architecture** Ravi Shankar,Eduardo B. Fernandez,2014-12-01 VLSI Electronics Microstructure Science Volume 20 VLSI and Computer Architecture reviews the approaches in design principles and techniques and the architecture for computer systems implemented in VLSI This volume is divided into two parts The first section is concerned with system design Chapters under this section focus on the discussion of such topics as the evolution of VLSI system performance and processor design considerations and VLSI system design and processing tools Part II of the book focuses on the architectural possibilities that have become cost effective with the development of VLSI circuits Topics on architectural requirements and various architectures such as the Reduced Instruction Set Extended Von Neumann Language Oriented and Microprogrammable architectures are elaborated in detail Also included are chapters that discuss the evaluation of architecture multiprocessing configurations and the future of VLSI Computer designers those evaluating computer systems researchers and students of computer architecture will find the book very useful *Computerworld* ,1976-03-15 For more than 40 years Computerworld has been the leading source of technology news and information for IT influencers worldwide Computerworld s award winning Web site Computerworld com twice monthly publication focused conference series and custom research form the hub of the world s largest global IT media network **Introducing Microprocessors** G. into account It examines 16 bit micro processor systems and describes their structure their behavior and their programming The principles of computer or ganization are treated at the component level This is done by means of a detailed examination of the characteristic functionali ty of microprocessors Furthermore the interactions between hardware and software that are typical of microprocessor technology are introduced Interfacing techniques are one of the focal points of these considerations This puplication is organized as a textbook and is intended as a self teaching course on 16 bit microprocessors for students of computer science and communications design engineers and users in a wide variety of technical and scientific fields Basic knowledge of boolean algebra is assumed The choice of material is based on the 16 bit microprocessors that are currently available on the market on the other hand the presentation is not bound to anyone of these microprocessors **Advance Microprocessor** A.K. Gautam, Each topic is well explained by illustration and photographs The book covers basic microprocessors to advanced processors in a consistent progression from theoretical concept to design considerations The operation of various microprocessors is described with the help of pin diagram functional diagram and timing diagrams A large number of working programs problem and the each chapter are summarized in the end **Computer Automation in Manufacturing** Thomas O. Boucher,2012-12-06 o Computer Automation in Manufacturing provide instruction in computer architecture interfacing to mechanical systems and software development for continuous control and discrete event systems This is accomplished by presenting theoretical material and hands on laboratory experiments The Microarchitecture of Pipelined and Superscalar Computers Amos R. Omondi,2013-03-09 This book is intended to serve as a textbook for a second course in the im plementation Le microarchitecture of computer architectures The subject matter covered is the collection of techniques that are used to achieve the highest performance in single processor machines these techniques center the exploitation of low level parallelism temporal and spatial in the processing of machine instructions The target audience consists students in the final year of an undergraduate program or in the first year of a postgraduate program in computer science computer engineering or electrical engineering professional computer designers will also also find the book useful as an introduction to the topics covered Typically the author has used the material presented here as the basis of a full semester undergraduate course or a half semester post graduate course with the other half of the latter devoted to multiple processor machines The background assumed of the reader is a good first course in computer architecture and implementation to the level in say Computer Organization and Design by D Patterson and H Hennessy and familiarity with digital logic design The book consists of eight chapters The first chapter is an introduction to all of the main ideas that the following chapters cover in detail the topics covered are the main forms of pipelining used in high performance uniprocessors a taxonomy of the space of pipelined processors and performance issues It is also intended that this chapter should be readable as a brief stand alone survey
