Bayoumi, 2012-12-06 Over the past few years the demand for high speed Digital Signal Processing DSP has increased dramatically New applications in real time image processing satellite communications radar signal processing pattern recognition and real time signal detection and estimation require major improvements at several levels algorithmic architectural and implementation These performance requirements can be achieved by employing parallel processing at all levels Very Large Scale Integration VLSI technology supports and provides a good avenue for parallelism Parallelism offers efficient solutions to several problems which can arise in VLSI DSP architectures such as 1 Intermediate data communication and routing several DSP algorithms such as FFT involve excessive data routing and reordering Parallelism is an efficient mechanism to minimize the silicon cost and speed up the processing time of the intermediate middle stages 2 Complex DSP applications the required computation is almost doubled Parallelism will allow two similar channels processing at the same time The communication between the two channels has to be minimized 3 Application specific systems this emerging approach should achieve real time performance in a cost effective way 4 Testability and fault tolerance reliability has become a required feature in most of DSP systems To achieve such

property the involved time overhead is significant Parallelism may be the solution to maintain acceptable speed performance
