direction is lost in another but erratic motions are caused by the length of the link itself the length of the eccentric rods and
the throw of the eccentric This is only another form of saying that if the radius of the link its point of suspension the length of
the rods and the throw of the eccentrics are not properly designed in the first instance there will be an erratic motion of the
link at one or more points in its stroke Take the radius of the link for example This is conventionally the distance from the
centre of valve stem connection with valve at mid stroke to the centre of the shaft but sometimes if the connections are very
short indeed this gives a very awkward link of short curve so that the link block binds or works hard then the link is made of
longer radius than the centre of the shaft or of such proportions that the engine will reverse easily If the engine works at full
stroke all the time this doesn't matter for the valve can be made to work properly at full stroke regardless of the link radius If
however it is intended to work expansively then difficulties arise at once if the link is of an improper radius for the lead
increases or decreases alarmingly with any shift of the link if the rods are straight connected or open as it is called If the rods
are crossed then the lead decreases toward mid gear It might be supposed that when the rods are of the proper length and
the link is of the correct radius then there would be no motion of the valve with the link in mid gear but this is not the case
for it will be observed by the diagram that the centres of the eccentric wheels and the centre of the shaft are not coincident
