R. Jena,Dr. Sohith Agarwal,2025-05-03 The concept of robots may be seen as highly developed automated systems when viewed from a certain point of view In addition robotics may be seen as both a scientific area and a technology that has emerged from automation via the collaborative efforts of several other fields of endeavour These are some other viewpoints about robotics In general an automated system requires relatively little in the way of intelligence or manipulation yet it may be simply programmed to achieve productivity goals This is because it is able to function without human intervention Additionally it is feasible for the system to do some processes more than once Keeping in mind that the mechanical structure of an automated system often only permits it to do the one task for which it was created is an essential point to bear in mind The capacity of a control unit to be reprogrammed is what determines the degree of flexibility that it possesses in the majority of cases it is simply able to adjust the timing of the actions that have been defined Hardware is responsible for supplying the mechanical capability to carry out an operation of movement and or manipulation that has been predetermined in advance This capability comprises mechanical electrical pneumatic and hydraulic components Hardware is also responsible for giving the capability to carry out the operation Because the control and operation counterpart is composed of software and electrical components the system is able to work independently and with a degree of flexibility This is made possible by the system s capacity to function independently Both of these are necessary elements that make up an automated system and they work together to accomplish their respective functions It is necessary to consider their design and operation as separate but complementary aims in order to attain and maintain optimal performance in an automated system This is because they are so dependent on one another that they are unable to function without one another
