Electromagnetic Wave Vs Mechanical Wave:

Electromagnetic Waves Propagation in Complex Matter Gustaf Kron, 2016-04-01 Electromagnetic waves are waves which can travel through the vacuum of outer space Mechanical waves unlike electromagnetic waves require the presence of a material medium in order to transport their energy from one location to another Light microwaves xrays and TV and radio transmissions are all kinds of electromagnetic waves They are all the same kind of wavy disturbance that repeats itself over a distance called the wavelength The mechanism of energy transport through a medium involves the absorption and reemission of the wave energy by the atoms of the material When an electromagnetic wave impinges upon the atoms of a material the energy of that wave is absorbed The absorption of energy causes the electrons within the atoms to undergo vibrations After a short period of vibrational motion the vibrating electrons create a new electromagnetic wave with the same frequency as the first electromagnetic wave While these vibrations occur for only a very short time they delay the motion of the wave through the medium Once the energy of the electromagnetic wave is reemitted by an atom it travels through a small region of space between atoms Once it reaches the next atom the electromagnetic wave is absorbed transformed into electron vibrations and then reemitted as an electromagnetic wave Electromagnetic Waves Propagation in Complex Matter emphasizes the topics of wave propagation and interaction with matters The book bridges the gap between physics and engineering in these issues
