Embedded System Applications Jean-Claude Baron, J.C. Geffroy, G. Motet, 2013-04-17 Embedded systems encompass a variety of hardware and software components which perform specific functions in host systems for example satellites washing machines hand held telephones and automobiles Embedded systems have become increasingly digital with a non digital periphery analog power and therefore both hardware and software codesign are relevant The vast majority of computers manufactured are used in such systems They are called embedded to distinguish them from standard mainframes workstations and PCs Although the design of embedded systems has been used in industrial practice for decades the systematic design of such systems has only recently gained increased attention Advances in microelectronics have made possible applications that would have been impossible without an embedded system design Embedded System Applications describes the latest techniques for embedded system design in a variety of applications This also includes some of the latest software tools for embedded system design Applications of embedded system design in avionics satellites radio astronomy space and control systems are illustrated in separate chapters Finally the book contains chapters related to industrial best practice in embedded system design Embedded System Applications will be of interest to researchers and designers working in the design of embedded systems for industrial applications

Analysis, Architectures and Modelling of Embedded Systems Achim Rettberg, Mauro C. Zanella, Michael Amann, Michael Keckeisen, Franz J. Rammig, 2009-09-04 This book presents the technical program of the International Embedded Systems Symposium IESS 2009 Timely topics techniques and trends in embedded system design are covered by the chapters in this volume including modelling simulation verification test scheduling platforms and processors Particular emphasis is paid to automotive systems and wireless sensor networks Sets of actual case studies in the area of embedded system design are also included Over recent years embedded systems have gained an enormous amount of processing power and functionality and now enter numerous application areas due to the fact that many of the formerly external components can now be integrated into a single System on Chip This tendency has resulted in a dramatic reduction in the size and cost of embedded systems As a unique technology the design of embedded systems is an essential element of many innovations Embedded systems meet their performance goals including real time constraints through a combination of special purpose hardware and software components tailored to the system requirements Both the development of new features and the reuse of existing intellectual property components are essential to keeping up with ever more demanding customer requirements Furthermore design complexities are steadily growing with

an increasing number of components that have to cooperate properly Embedded system designers have to cope with multiple goals and constraints simultaneously including timing power reliability dependability maintenance packaging and last but not least price
