Review of Progress in Quantitative Nondestructive Evaluation Donald O. Thompson, Dale E. Chimenti, 1991 An Introduction To The Method Of Fundamental Solutions Alexander H-d Cheng, Ching-shyang Chen, Andreas Karageorghis, 2025-03-11 Over the past two decades the method of fundamental solutions MFS has attracted great attention and has been used extensively for the solution of scientific and engineering problems The MFS is a boundary meshless collocation method which has evolved from the boundary element method In it the approximate solution is expressed as a linear combination of fundamental solutions of the operator in the governing partial differential equation One of the main attractions of the MFS is the simplicity with which it can be applied to the solution of boundary value problems in complex geometries in two and three dimensions The method is also known by many different names in the literature such as the charge simulation method the de singularization method the virtual boundary element method etc Despite its effectiveness the original version of the MFS is confined to solving boundary value problems governed by homogeneous partial differential equations To address this limitation we introduce various types of particular solutions to extend the method to solving general inhomogeneous boundary value problems employing the method of particular solutions This book consists of two parts Part I aims to provide theoretical support for beginners In the spirit of reproducible research and to facilitate the understanding of the method and its implementation several MATLAB codes have been included in Part II This book is highly recommended for use by post graduate researchers and graduate students in scientific computing and engineering

Protection of Critical Infrastructure by Unmanned Systems P. Daponte,F. Paladi,2023-02-17 The attention of many developed countries has increasingly focused on the security and protection of critical infrastructure The use of Unmanned Systems USs for this purpose has been growing rapidly in recent years as advances in technology increased versatility and smaller size together with the reduced risks and costs associated with removing the need for a pilot or operator on board have all made these systems more attractive This book Monitoring and Protection of Critical Infrastructure by Unmanned Systems presents 15 papers delivered at the NATO Advanced Training Course ATC of the same name hosted in Chisinau the Republic of Moldova from 30 May to 5 June 2022 This event was held in a hybrid format and was attended in person by 12 of the 31 speakers and the majority of the 92 attendees The aim of the ATC was to explore the monitoring and protection of critical infrastructure using USs Various USs including ground control stations GCS data communication links and a range of unmanned aerial UAV ground UGV and underwater UUV vehicles are covered and the papers included here also deal with topics such as the use of drones for buildings inspection and the new technologies which can help with the recognition and monitoring of anthropogenic threats and natural hazards There is also a focus on data analysis and modeling Providing an overview of the use of unmanned vehicle systems and sensor network technology for monitoring and protection the book will be of interest to all those working to protect critical infrastructure Seismic Wave Propagation in Non-Homogeneous Elastic Media by Boundary Elements George D. Manolis,Petia S. Dineva,Tsviatko V. Rangelov,Frank Wuttke,2016-09-23 This book focuses on the mathematical potential and computational efficiency of the Boundary Element Method BEM for modeling seismic wave propagation in either continuous or discrete inhomogeneous elastic viscoelastic isotropic anisotropic media containing multiple cavities cracks inclusions and surface topography BEM models may take into account the entire seismic wave path from the seismic source through the geological deposits all the way up to the local site under consideration The general presentation of the theoretical basis of elastodynamics for inhomogeneous and heterogeneous continua in the first part is followed by the analytical derivation of fundamental solutions and Green s functions for the governing field equations by the usage of Fourier and Radon transforms The numerical implementation of the BEM is for antiplane in the second part as well as for plane strain boundary value problems in the third part Verification studies and parametric analysis appear throughout the book as do both recent references and seminal ones from the past Since the background of the authors is in solid mechanics and mathematical physics the presented BEM formulations are valid for many areas such as civil engineering geophysics material science and all others concerning elastic wave propagation through inhomogeneous and heterogeneous media The material presented in this book is suitable for self study The book is written at a level suitable for advanced undergraduates or beginning graduate students in solid mechanics computational mechanics and fracture mechanics
