Three-dimensional Computer Vision Olivier Faugeras, 1993 This monograph by one of the world's leading vision researchers provides a thorough mathematically rigorous exposition of a broad and vital area in computer vision the problems and techniques related to three dimensional stereo vision and motion The emphasis is on using geometry to solve problems in stereo and motion with examples from navigation and object recognition Faugeras takes up such important problems in computer vision as projective geometry camera calibration edge detection stereo vision with many examples on real images different kinds of representations and transformations especially 3 D rotations uncertainty and methods of addressing it and object representation and recognition His theoretical account is illustrated with the results of actual working programs Three Dimensional Computer Vision proposes solutions to problems arising from a specific robotics scenario in which a system must perceive and act Moving about an unknown environment the system has to avoid static and mobile obstacles build models of objects and places in order to be able to recognize and locate them and characterize its own motion and that of moving objects by providing descriptions of the corresponding three dimensional motions The ideas generated however can

be used indifferent settings resulting in a general book on computer vision that reveals the fascinating relationship of three dimensional geometry and the imaging process
