conveys its underlying intellectual excitement The recent development of dynamic geometry software offers an opportunity to translate the study of geometry into a contemporary vernacular However this involves transformations along multiple dimensions of the conceptual and practical context of learning Translating Euclid steps through the multiple challenges involved in redesigning geometry education to take advantage of computer support Networked computers portend an interactive approach to exploring dynamic geometry as well as broadened prospects for collaboration The proposed conception of geometry emphasizes the central role of the construction of dependencies as a design activity integrating human creation and mathematical discovery to form a human centered approach to mathematics This book chronicles an iterative effort to adapt technology theory pedagogy and practice to support this vision of collaborative dynamic geometry and to evolve the approach through on going cycles of trial with students and refinement of resources It thereby provides a case study of a design based research effort in computer supported collaborative learning from a human centered informatics perspective
