

PARTS OF A TELESCOPE

Eyepiece

The eyepiece forms one of the most essential parts of a telescope. It allows the user to observe the specific object's telescopic image. The amount of magnification of a telescope is determined by the ratio of the focal length of the objective lens/mirror divided by that of the eyepiece lens/mirror.

Finderscope

A finder scope pertains to a small telescope that is attached to the main telescopic tube. It is used to find the estimated location of the object that is to be viewed. It has a lower magnification and a wider field of view. It is one of the important parts of a telescope.

Lenses

All refracting telescopes use two lenses. The eyepiece lens is one lens, and the objective lens is the other. Commonly, these are biconcave or curved outwards on both sides. A telescope's lens is similar to the lens of eyeglasses, as it bends light passing through it.

Telescope Tube

The main mirror is located inside the telescope tube, which serves as the instrument's body. A telescope tube typically has a diameter of around 8 inches. It helps in improving the focal length setting by adjusting the knob below the visual back.

Structural Support

High-power telescopes are generally large and are not used as hand-held instruments. Different platforms, such as tripods, are used in telescopic designs to install the telescope correctly.

Mirrors

If a telescope uses mirrors, then it is referred to as a reflecting telescope. Compared to a lens, a mirror can be very thin. Also, a bigger mirror does not need to be thicker. It's because rebounding off the mirror concentrates the light.

Hobby Telescope Guide:

A User's Guide to the Meade LXD55 and LXD75 Telescopes Martin Peston, 2010-04-28 I have owned telescopes for over 25 years since I was a young lad I purchased an LXD55 AR 6 Refractor in 2002 and was one of the first to own one in the UK I am also a proud owner of an LXD75 SC 8 Armed with these two very different telescopes I have spent many hours searching the skies for interesting objects using Meade's Autostar Goto facility My motivation to write a book about the LXD Goto telescope series first came from comments about an LXD55 AR 6 Refractor review that was published on the LXD55.com website From then on I have had regular emails from people asking technical questions about the telescope and which model is best suited for them Whilst attending Star parties in the UK I found that many LXD owners would struggle to use them even at a basic level especially if they have never owned or used an equatorially mounted Goto telescope before Since the first LXD55 models came out in early 2002 owners have struggled to find useful information to help them use the telescopes to the best advantage There have been mixed reactions about its quality and performance Hence this book is directed towards those who are new to Goto and the LXD telescope

The Design and Construction of Large Optical Telescopes Pierre Bely, 2006-05-26 There is no dearth of books on telescope optics and indeed optics is clearly a key element in the design and construction of telescopes But it is by no means the only important element As telescopes become larger and more costly other aspects such as structures pointing wavefront control enclosures and project management become just as critical Although most of the technical knowledge required for all these elds is available in various specialized books journal articles and technical reports they are not necessarily written with application to telescopes in mind This book is a first attempt at assembling in a single text the basic astronomical and engineering principles used in the design and construction of large telescopes It aims to broadly cover all major aspects of the eld from the fundamentals of astronomical observation to optics control systems structural mechanical and thermal engineering as well as specialized topics such as site selection and program management This subject is so vast that an in depth treatment is obviously impractical Our intent is therefore only to provide a comprehensive introduction to the essential aspects of telescope design and construction This book will not replace specialized scientific and technical texts But we hope that it will be useful for astronomers managers and systems engineers who seek a basic understanding of the underlying principles of telescope making and for specialists who wish to acquaint themselves with the fundamental requirements and approaches of their colleagues in other disciplines
