

ENGINEERING VIBRATION

SECOND EDITION

Daniel J. Inman

This text presents material common to a first course in vibration and the integration of computational software packages into the development of the text material (specifically makes use of MATLAB, MathCAD and Mathematica). This allows solution of difficult problems, provides training in the use of codes commonly used in industry, encourages students to experiment with equations of vibration by allowing easy "what if" solutions. This also allows students to make precise response plots, computation of frequencies, damping ratios, and mode shapes. This encourages students to learn vibration in an interactive way to solidify the design components of vibration and to integrate nonlinear vibration problems earlier in the text. The text explicitly addresses design by grouping design related topics into a single chapter and using optimization, and it contrasts the computation of natural frequencies and mode shapes in the standard eigenvalue problem, providing efficient and exact computation of the modal properties of a system. In addition, the text covers modal testing methods, which are typically not discussed in competing texts.

Highlights of the Second Edition

- Integration of computational software to include Mathematica and MathCAD as well as MATLAB in each chapter, updated Engineering Vibration Toolbox and web site
- Integration of the numerical simulation and computing into each topic by chapter
- Nonlinear considerations added at the end of each early chapter through simulation
- Additional problems and examples
- Updated solutions manual available on CD for use in teaching
- User "windows" to remind the reader of relevant facts outside the flow of the text development
- Introduces modal analysis (both theoretical and experimental)
- Introduces dynamic finite element analysis
- Separate chapter on design and special sections to emphasize design in vibration
