Engineering Guide For Wood Frame Construction 2015:

Structural Wood Design Abi Aghayere, Jason Vigil, 2017-04-28 This text provides a concise and practical guide to timber design using both the Allowable Stress Design and the Load and Resistance Factor Design methods. It suits students in civil structural and construction engineering programs as well as engineering technology and architecture programs and also serves as a valuable resource for the practicing engineer. The examples based on real world design problems reflect a holistic view of the design process that better equip the reader for timber design in practice. This new edition now includes the LRFD method with some design examples using LRFD for joists, girders and axially load members. It is based on the 2015 NDS and 2015 IBC model code. It includes a more in depth discussion of framing and framing systems commonly used in practice such as metal plate connected trusses, rafter and collar tie framing and pre engineered framing. It includes sample drawings, drawing notes and specifications that might typically be used in practice. It includes updated floor joist span charts that are more practical and are easy to use. It includes a chapter on practical considerations covering topics like flitch beams, wood poles used for footings, reinforcement of existing structures and historical data on wood properties. It includes a section on long span and high rise wood structures. It includes an enhanced student design project.

Principles of Structural Design Ram S. Gupta, 2019-06-17 Timber, steel and concrete are common engineering materials used in structural design. Material choice depends upon the type of structure, availability of material and the preference of the designer. The design practices, the code requirements of each material are very different. In this updated edition, the elemental designs of individual components of

each material are presented together with theory of structures essential for the design Numerous examples of complete structural designs have been included A comprehensive database comprising materials properties section properties specifications and design aids has been included to make this essential reading *Timber Buildings and Sustainability* Giovanna Concu,2019-12-04 The construction sector alone accounts for 40 percent of resource consumption and environmental pollution In line with the current considerations on environmental sustainability particular attention is paid to eco sustainable building materials such as timber Timber is able to perform both load bearing and comfort constructive functions It is also a natural renewable and recyclable material However its use as an engineering material calls for constant development and research This book provides insight into the spread of the use of timber in the construction industry presenting some thoughts on important aspects related to production design and responsible use **Structural**
