 When it is rotated, the conductor will develop within itself a current according to Faraday's Law. ✓
 The closer the conductor moves to the pole, the greater the induced emf. ✓
 When the conductor moves past the pole, the induced voltage will decrease due to a decrease of the flux density. ✓
 When the conductor moves to a point where it experiences the least amount of flux, the emf will be close to or equal to 0 V. ✓
 When the conductor moves further, towards the opposite pole, the flux it experiences will cause an emf to develop in the opposite direction as that of the initial pole.
 The process repeats until all motion is stopped.
 The signal can be represented by the formula: $e = E_{\max} \sin \theta$ (5)
