

Chapter 10: Meiosis and Sexual Life Cycles

Heredity - the transmission of traits from one generation to the next.

Variation - exists in populations that reproduce sexually, offspring are not identical to their parents.

Genetics - is the scientific study of heredity and hereditary variation.

- **Asexual Reproduction**

- A single individual is the sole parent of an offspring.

- Ex: **binary fission** of bacteria

- Ex: **regeneration** of a sea star arm

- Some multi-celled organisms can reproduce this way through cloning, an offspring begins as a mass of cells called a bud (hydra) → **budding**

- Offspring are genetically identical to parents, "clones"

- Variation can occur through mutations.

- This type of reproduction occurs through the process of mitosis.

I. Inheritance of Genes

Genes – are the units of heredity and are made up of segments of DNA. It is a section of DNA on a chromosome.

Genes are passed to the next generation via reproductive cells (sperm and eggs) called gametes.

- **Sexual Reproduction**

- Two parents give rise to offspring that have unique combinations of genes inherited from the two parents. Genetically unique offspring.

- Need to find a mate, takes time.

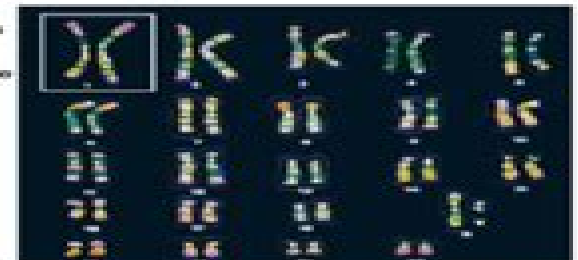

- **Sets of chromosomes in humans**

- Human somatic cells have 23 pairs chromosomes or 46 total chromosomes.

- A **karyotype** is an ordered display of the pairs of chromosomes from a cell.

- The two chromosomes in each pair are called **homologous chromosomes** or **homologs**.

- one from mom, one from dad
- chromosomes that carry genes that control the same trait (eye color, etc.)
- pairs 1-22 are autosomes
- pair 23 are sex chromosomes (male has XY or female has XX)

This is a sex cell (n) with 23 chromosomes
