GEOMETRIC SEQUENCE

We learned that a **geometric sequence** is a number sequence in which each number is found by multiplying the preceding number by a constant. Its general term is $a_n = a_1 r^{n-1}$. The value r is called the common ratio. It is found by taking any term in the sequence and dividing it by its preceding term. To determine whether a number sequence is geometric, divide each number by the preceding number. A geometric sequence is a specific progression or sequence of numbers in which each succeeding number is a fixed multiple of the previous number. Please allow me to explain. Assume my first number is 9, and I multiply 9 by the number 4. So, I multiply that by four to obtain 36, the second number.

If we are looking for the 6th term in the sequence, we have to follow the formula of the geometric sequence, which is $a_n = a_1 r^{n-1}$, to make it easier to find it. Example:

Given: $n=6$

$$a_1=9$$

$$r=4$$

Solution: $a_n = a_1 r^{n-1}$

$$a_6 = 9 (4)^{6-1}$$

$$= 9 (4)^5$$

$$= 9 (1024)$$

$$a_6 = 9216$$

The real-life application of this topic is a **ball bouncing**, which is an example of a finite geometric sequence. Each time the ball bounces, its height gets cut in half. If the ball's first height is 4 ft, the next time it bounces, its highest bounce will be at 2 ft, then 1 ft, then 6 inches or $\frac{1}{2}$ ft, and so on, until the ball stops bouncing.
