

Endocrine System

Works with the Nervous System to coordinate body processes through hormones transported in the blood.

- Made up of glands & organs that do not connect
- Chemical signals are slow acting, but longer duration

Neurohormones use the bloodstream for transport like all other hormones, but are secreted from a neuron rather than an endocrine cell.

Ex. ADH which is produced in the hypothalamus, but it is stored & released by the posterior pituitary gland.

- Can diffuse through cell membranes bc they are hydrophobic or nonpolar.
- They bind to Intracellular Receptors that are located in the cytoplasm or nucleus of a cell.

Includes estrogen, testosterone, progesterone, cortisol & aldosterone, but thyroxine, a thyroid hormone, also diffuses through the membrane.

Steroid Hormones can trigger gene activation & protein synthesis in target cells.

Protein Hormones change the activity of existing enzymes in target cells.

Hypothalamus	Communicates w Pituitary by secreting RH & IH, controls the rest of the ES
Pituitary Gland	Plays important role in growth & development
