**Meiosis/Reproduction Biology** Holt Rinehart & Winston, Holt, Rinehart and Winston Staff, 2004-01-01 *The Evolution of Sex Determination* Leo Beukeboom, Nicolas Perrin, 2014-06-12 Sexual reproduction is a fundamental aspect of life It is defined by the occurrence of meiosis and the fusion of two gametes of different sexes or mating types Sex determination mechanisms are responsible for the sexual fate and development of sexual characteristics in an organism be it a unicellular alga a plant or an animal In many cases sex determination is genetic males and females have different alleles or different genes that specify their sexual morphology In animals this is often accompanied by chromosomal differences In other cases sex may be determined by environmental e g temperature or social variables e g the size of an organism relative to other members of its population Surprisingly sex determination mechanisms are not evolutionarily conserved but are bewilderingly diverse and appear to have had rapid turnover rates during evolution Evolutionary biologists continue to seek a solution to this conundrum What drives the surprising dynamics of such a fundamental process that always leads to the same outcome two sex types male and female The answer is complex but the ongoing genomic revolution has already greatly increased our knowledge of sex determination systems and sex chromosomes in recent years This novel book presents and synthesizes our current understanding and clearly shows that sex determination evolution will remain a dynamic field of future research The Evolution of Sex Determination is an advanced research level text suitable for graduate students and researchers in genetics developmental biology and evolution **Study of Meiosis** Himanshu Gupta, 2013-01 Reductional nature of meiosis is responsible to maintain the ploidy in eukaryotes In sexual reproduction Meiotic division produces gametes of half ploidy and fertilization restores original chromosome number In the meiosis sister chromatids are monoorientated which leads to separation of homologous chromosomes This is followed by separation of sister chromatid in meiosis II because of biorientation of sister chromatids Comparison of meiosis with mitosis reveals that monoorientation of sister chromatids is the main reason for halving the ploidy According to the present hypothesis Monopolin complex A four subunit complex directs monopolar attachment of sister chromatids Present study is done to reveal the nature and function of this complex Cell cycle arrest mutants were created and verified to maximize the number of cells at particular stage by deleting or shuffling the promoter of a particular gene Then Csm1 subunit of monopolin complex was affinity tagged and verified in arrested cells As future prospects of this work affinity purification of Csm1 can be done Comparison of protein profiles obtained will help to
