design methodologies to model based nonlinear control of aeroengines focusing on 1 modelling of aeroengine systems both component level and identification based models will be extensively studied and compared and 2 advanced nonlinear control designs set point control transient control and limit protection control approaches will all be investigated The model based design has been one of the pivotal technologies to advanced control and health management of propulsion systems It can fulfil advanced designs such as fault tolerant control engine modes control and direct thrust control As a consequence model based design has become an important research area in the field of aeroengines due to its theoretical interests and engineering significance One of the central issues in model based controls is the tackling of nonlinearities There are publications concerning with either nonlinear modelling or nonlinear controls yet they are scattered throughout the literature It is time to provide a comprehensive summary of model based nonlinear controls Consequently a series of important results are obtained and a systematic design methodology is developed which provides consistently enhanced performance over a large flight operational envelope and it is thus expected to provide useful guidance to practical engineering in aeroengine industry and research
