

## **Assignment 2 – Plate Tectonics and the Origin of Volcanic Igneous Rocks**

### **Objectives**

**1. Understand how stress, friction and plate boundaries determine if Earth's surface features, including volcanoes, form.**

**2. Understand and explain how plate boundaries**

**are the physical and geological results of rock melting in high heat regions, from the interior to ground, magma, and plate movement.**

### **Introduction**

Plate tectonics is the science of the movement of large pieces of the Earth's crust, known as plates, across the Earth's surface. These plates move horizontally, either towards or away from each other, or in different directions. The plates are made of solid rock, and their movement is driven by the heat of the Earth's interior, which causes the plates to move. The plates are also broken into smaller pieces, known as **tectonic plates**, which move in different directions.

One of the most important features of plate tectonics is the **mid-ocean ridge**, which is a long, narrow, and deep underwater mountain range. It is formed by the movement of tectonic plates, which move apart and create new oceanic crust. The ridge is also a source of **hydrothermal vents**, which are hot, mineral-rich fluids that rise from the seafloor. These vents are also a source of **hydrothermal energy**, which is used to generate electricity.

**Volcanoes** are another important feature of plate tectonics. They are formed by the movement of tectonic plates, which move apart and create new oceanic crust. The magma that rises from the seafloor is also a source of **hydrothermal energy**, which is used to generate electricity. Volcanoes are also a source of **hydrothermal energy**, which is used to generate electricity.
