Robert Jansen,Xueqiong Wu, Lin Fan,Ranjan Nanda,Raquel Villar-Hernández,2025-05-29 Tuberculosis TB threatens global public health and remains one of the major infectious diseases worldwide Effective detection and treatment of both drug sensitive and drug resistant TB are key challenges in the fight against TB Currently only about 50% of the WHO target TB cases are detected and only 30 40% of drug resistant TB cases are recognized Treatment success rates are approximately 85% for drug sensitive TB and drop to only 60% for multi drug resistant TB MDR TB on average worldwide Early detection of TB cases is the first step to providing patients with appropriate treatment Recognizing drug resistant TB is more challenging and requires quick and accurate drug susceptibility test DST methods In addition to improved diagnosis and DST the discovery of new drug targets is crucial for TB control This Research Topic focusses on TB and drug resistance diagnosis and drug target discovery It aims to explore novel TB diagnosis methods to quickly find TB cases and recognize drug resistance DST for anti TB drugs is also essential to guide the further diagnosis of drug resistant TB how to evaluate and compare them and establish new DST methods to further guide clinics to use rationally is the other purpose under this topic At the same time this Research Topic aims to explore new drug resistance mechanisms and tools to study drug resistance Finally it explores new drug targets and tools to study them      **Sustainable Energy Production and Consumption: System**

**Genomics, Functional, Evolutionary, and Ecological Perspectives on the Biology of Carnivorous Plants** Magdy S. Alabady,Jim Leebens-Mack,Kenji Fukushima,Jeremy D. Rentsch,Russell L. Malmberg,2024-12-13 Darwin was fascinated by the multitude of physiological and morphological adaptations of carnivorous plants and consequently referred to them as the most wonderful plants in the world The carnivorous behavior evolved independently at least six times in five angiosperm orders in plants that live in barren nutrient deficient environments Carnivorous plants capture insects to get access to the nitrogen and phosphorus contained in their bodies Their leaves are specialized to perform multiple functions secrete attractive scents capture insects secrete extracellular digestive enzymes absorb nutrients photosynthesize and develop symbioses Despite their independent origins there is a remarkable morphological convergence of the traps and physiological convergence of the mechanisms for digesting and assimilating prey These charismatic plants have evolved at least five major types of insect capturing mechanisms and can also be autotrophic under certain sentimental conditions These complex plants can be unique models for studying rapid organ movements excitability enzyme secretion nutrient absorption food web relationships phylogenetic and intergeneric relationships symbiosis cross species regulatory networks and convergent evolution The genomics revolution is giving us

novel insights into the evolutionary history of these plants and the nature of their unique adaptations For instance the U gibba genome reveals the role of small scale tandem duplications in the carnivorous adaptation a potential explanation of the evolution of carnivorous traits such as attraction trapping digestions and absorption came from the genome of C follicularis and a mapping population including F1 F2 and BC and their genetic linkage map have been developed for the Sarracenia species To increase our functional understanding of carnivorous plants further these findings need to be related to the unique properties of their habitats and interactions among plants with insects and microbes The multiple origins and evolutionary convergence of their specific nutrient economics renders carnivorous plants most interesting study systems in functional ecology Altogether these advances are ushering a new era of understanding of plant carnivory at genomics molecular and ecological functions and evolutionary levels
