Effects for Rotating Objects Ryspek Usubamatov, 2025-08-12 This book highlights an analytical solution for the dynamics of
axially rotating objects It also presents the theory of gyroscopic effects explaining their physics and using mathematical
models of Euler's form for the motion of movable spinning objects to demonstrate these effects The major themes and
approaches are represented by the spinning disc and the action of the system of interrelated inertial torques generated by
the centrifugal and Coriolis forces as well as the change in the angular momentum The interrelation of inertial torques is
based on the dependency of the angular velocities of the motions of the spinning objects around axes by the principle of
mechanical energy conservation These kinetically interrelated torques constitute the fundamental principles of the
mechanical gyroscope theory that can be used for any rotating objects of different designs like rings cones spheres
paraboloids propellers etc Lastly the mathematical models for the gyroscopic effects are validated by practical tests This
book is highlighted in its already third edition The new edition comprises many new sections for several chapters or new
chapters The most important ones are Chapter 3 includes a mathematical model for the section inertia torques acting on the
spinning annulus and thin ring The latter does not have a full solution because the handbooks comprise simplified
parameters that cannot be used for an exact solution Chapter 4 offers mathematical model for the arbitrary disposition of the
spinning object in space that shows the action of the additional four inertial torques acting on the third axis and new
dependencies of gyroscope motions Chapter 7 now presents mathematical model for the gyroscope nutation with a full
solution The known mathematical model presents a partial solution due to the complexity of the problem **Industrial
