*A Cost-Benefit Analysis of Case Management Activities for Diabetes* Felix J. Bradbury, 2010-06 The economic and human costs of diabetes in the U S population place an enormous burden on its healthcare system as well as on employers diabetics and their respective families Many Medicare Advantage plans have responded to this burden by implementing diabetes case management programs DCMPs aimed at reducing inappropriate health services utilization improving health outcomes and containing costs While the use of DCMPs is common to many health plans the research regarding their effectiveness has been sparse or inconclusive The purpose of this study was to help fill a critical gap in the research literature by evaluating the effect of a diabetes case management program known as CareContact on a Medicare population in Texas The study population consisted of 2 972 confirmed diabetic members who were continuously enrolled in SelectCare of Texas a Medicare Advantage plan for the two year period between January 1 2005 and December 31 2006 To be eligible for this study diabetic members had to have a minimum of 6 months without exposure to CareContact and 6 months of exposure to CareContact after the initial exposure Twelve separate cohorts defined by date of initial program exposure were evaluated using a one group interrupted time series design Cross sectional time series analysis which combines ordinary least square regression techniques and time series analyses was used to evaluate program effectiveness After controlling for confounders and the effects of time the data indicated that membership in the DCMP was associated with increased costs and increased utilization over the two year study period The study points to the need for further research into the effectiveness of diabetes case management programs especially for participants of Medicare Advantage health plans Health Care Finance and the Mechanics of Insurance and Reimbursement Michael K. **Medicare Risk Adjustment and HCC Clinical Documentation Overview** The Coders Choice

LLC,2019-03-09 Risk adjustment is a method to offset the cost of providing health insurance for individuals such as those with chronic health conditions who represent a relatively high risk to insurers Under risk adjustment an insurer who enrolls a greater than average number of high risk individuals receives compensation to make up for extra costs associated with those enrollees In the absence of risk adjustment policies insurers have a financial incentive to deny coverage to higher risk individuals and to write exclusions into policies or impose unaffordable premiums for individuals with pre existing medical conditions Risk adjustment aims to make comprehensive insurance available to all individuals regardless of risk and to allow plans that insure sicker than average populations to charge similar average premiums as plans that insure relatively healthy populations The risk adjustment model enacted under the Affordable Care Act ACA or Obamacare is budget neutral Total payments to insurers do not increase Rather insurers covering a relatively greater number of healthy individuals must contribute to a risk adjustment pool that funds additional payments to those insurers covering a larger portion of high risk individuals Risk adjustment models typically use an individual s demographic data age sex etc and diagnoses to determine a risk score The risk score is a relative measure of the probable costs to insure the individual To cite a simple example an individual with diabetes will have a higher risk score his or her predicted healthcare costs will be greater than an otherwise statistically identical individual without diabetes Older individuals typically have a higher risk score than younger individuals and those individuals with a personal or family history of certain conditions may garner a higher risk score than individuals without such a history There are several risk adjustment models The Centers for Medicare however some risk adjustment models may include severe conditions relevant to a young demographics such as pregnancy and congenital abnormalities All risk adjustment models depend on complete and accurate reporting of patient data CMS requires that a qualified healthcare provider identify all chronic conditions and severe diagnoses for each patient to substantiate a base year health profile for those individuals Documentation in the medical record must support the presence of the condition and indicate the provider s assessment and plan for management of the condition This must occur at least once each calendar year for CMS to recognize that the individual continues to have the condition This information is used to predict costs in the following year As such incorrect or non specific diagnoses can affect not only patient care and outcomes but also reimbursement for that care going forward
