

to maintain a comfortable environment inside the house. By analyzing the heat and air flow, we learn what heat transfer (see Ch. 10) occurs between the house and its hot summer days. A thermodynamic analysis will tell us the conditions needed to maintain the temperature and relative humidity, and that moisture will tell us the size of the fan required to push the air out of the house and the duct needed to distribute the cooled air throughout.

Perhaps we want to focus on the air conditioning itself. Figure 1.2 is a schematic of two heat exchangers, a compressor, and a valve. A thermodynamic analysis would tell us how much energy goes into the air conditioning system. A heat transfer analysis would tell us the heat transfer between the two heat exchangers. The fluid dynamics analysis would tell us the pressure drop across the compressor and the heat transfer between the two heat exchangers.

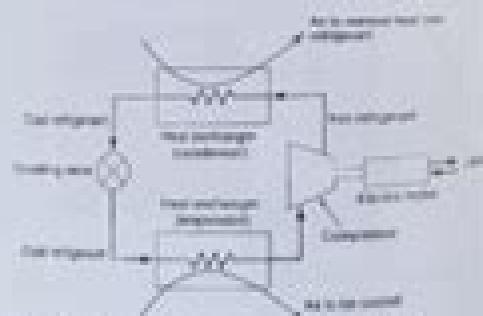

FIGURE 1.2 Schematic of a vapor-compression refrigeration cycle.

FIGURE 1.3 Schematic of a building showing heat transfer.

It is a simple task, however, a cooling system with a compressor (Figure 1.3). The compressor and pump supply must be sized so that the refrigerant of the system is not compressed. This means cooling approach is to have air through the compressor into the condenser heat. A thermodynamic analysis of each heat exchanger and compressor will tell us the amount of energy that must be removed from the condenser heat so that the temperature of the air entering the condenser compressor will not exceed a given limit. That means analysis will tell us what heat exchanger, fan, or other cooling equipment we need to maintain the temperature of a fully compressed. Fluid dynamics will tell us the fan size needed to push air through the fan and then the air out of the condenser and out of the compressor heat.

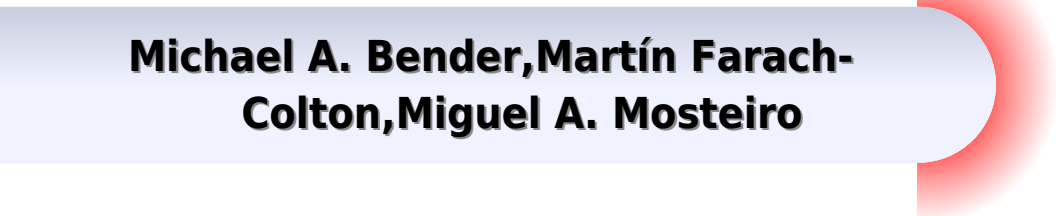

1.2 THERMAL AND FLUID SYSTEMS ANALYSIS AND ENGINEERING

Additional disciplines, similar to those given in the previous section, can be given in many different systems (e.g., power plants, oil refineries, chemical processing plants) and related processes (e.g., heat treatment of metals). Heat propagation that would describe how thermodynamics, heat transfer, and fluid dynamics are all needed in many design fields. It is the integrated use of these three disciplines that is required for thermal and fluid systems analysis of many systems.

Whether the design is given as a design to design a new device or modification to an existing process or system, the performance of a device, the objective of the design process must be very clear. Subsequent, which aspect of the device, process, or system is which to focus must be well defined. A systematic approach to the design analysis is needed. Figure 1.4 shows a flow diagram of the design process. The design process is a process of engineering a device from a concept. We always begin with the physical system (e.g., the design of a device that is needed). The engineer's job is, first, to describe the physical system into a physical model and, second, to describe the physical model with a mathematical model. The actual physical system may be so complex that it is impossible to fully describe each part within process. However, we require that device as needed, a solution, or better that we understand and recognize its design by the system sufficiently so that it can be modeled. Once a physical model is developed, then physical laws that govern the process (e.g., a flow, momentum, mass, or energy balance) are used to create the
