Shared-Memory Parallelism Can be Simple, Fast, and Scalable Julian Shun, 2017-06-01 Parallelism is the key to achieving high performance in computing However writing efficient and scalable parallel programs is notoriously difficult and often requires significant expertise To address this challenge it is crucial to provide programmers with high level tools to enable them to develop solutions easily and at the same time emphasize the theoretical and practical aspects of algorithm design to allow the solutions developed to run efficiently under many different settings This thesis addresses this challenge using a three pronged approach consisting of the design of shared memory programming techniques frameworks and algorithms for important problems in computing The thesis provides evidence that with appropriate programming techniques frameworks

and algorithms shared memory programs can be simple fast and scalable both in theory and in practice The results developed in this thesis serve to ease the transition into the multicore era The first part of this thesis introduces tools and techniques for deterministic parallel programming including means for encapsulating nondeterminism via powerful commutative building blocks as well as a novel framework for executing sequential iterative loops in parallel which lead to deterministic parallel algorithms that are efficient both in theory and in practice The second part of this thesis introduces Ligra the first high level shared memory framework for parallel graph traversal algorithms The framework allows programmers to express graph traversal algorithms using very short and concise code delivers performance competitive with that of highly optimized code and is up to orders of magnitude faster than existing systems designed for distributed memory This part of the thesis also introduces Ligra which extends Ligra with graph compression techniques to reduce space usage and improve parallel performance at the same time and is also the first graph processing system to support in memory graph compression The third and fourth parts of this thesis bridge the gap between theory and practice in parallel algorithm design by introducing the first algorithms for a variety of important problems on graphs and strings that are efficient both in theory and in practice For example the thesis develops the first linear work and polylogarithmic depth algorithms for suffix tree construction and graph connectivity that are also practical as well as a work efficient polylogarithmic depth and cache efficient shared memory algorithm for triangle computations that achieves a 2.5x speedup over the best existing algorithms on 40 cores This is a revised version of the thesis that won the 2015 ACM Doctoral Dissertation Award

Rebounding Marine Mammal Species and Conservation Recovery Challenges Andrea Bogomolni, Kristina Cammen, Jennifer Jackman, 2025-03-19

Marine mammals have been valued for millennia for their cultural significance and more often their exploitative resource value Many large whale species remain imperilled or are only recently returning from the brink of extinction In contrast recent conservation measures have allowed for the successful rebound and recovery of many cetaceans and pinniped species some to the point of perceived overabundance whether referring to 1 200 Hawaiian monk seals or 7 million harp seals In addition to their continued intrinsic value alive and thriving today we also appreciate the value of marine mammal species to ecosystem health Yet as we grapple with a lack of historical baselines and uncertain ecological and social carrying capacities several conflicts are emerging at the growing interface between humans and marine mammals These conflicts include ship strikes depredation bycatch impacts of ecotourism competition for resources changing cultural values and political challenges to marine mammal conservation Despite the emergence of theory and application of human dimensions of wildlife in the terrestrial realm the rebound of marine mammals and how we address these conflicts in the coastal and ocean environment are often overlooked when discussing human wildlife conflict issues and solutions This Research Topic aims to increase awareness of these issues to advance the discussion on how we can address these challenges in ocean systems Conflicts with rebounding populations of marine mammals have emerged across diverse ecological sociological economic and political contexts Conflicts often arise from assessing how marine mammals fit into the human world based on the baseline understanding of one's own personal experiences or specific community contexts rather than broader and complex ecosystems understanding or historical context How do we address these emerging complex socio ecological problems related to marine mammals Who defines the problems and how are the problems defined How do we consider often opposing values and interests in the development of solutions and how do we engage diverse stakeholders in decision making processes that shape how we will manage and coexist with marine mammal populations for generations to come How can different disciplines help build the knowledge foundation and strategies necessary to address these challenges
