Mathematical Methods for Mechanics Eckart W. Gekeler, 2008-09-26 Mathematics is undoubtedly the key to state of the art high technology It is an international technical language and proved to be an eternally young science to those who have learned its ways Long an indispensable part of research thanks to modeling and simulation mathematics is enjoying particular vitality now more than

ever Nevertheless this stormy development is resulting in increasingly high requirements for students in technical disciplines while general interest in mathematics continues to wane at the same time This book and its appendices on the Internet seek to deal with this issue helping students master the difficult transition from the receptive to the productive phase of their education The author has repeatedly held a three semester introductory course titled Higher Mathematics at the University of Stuttgart and used a series of handouts to show further aspects make the course contents more motivating and connect with the mechanics lectures taking place at the same time One part of the book has more or less evolved from this on its own True to the original objective this part treats a variety of separate topics of varying degrees of difficulty nevertheless all these topics are oriented to mechanics Another part of this book seeks to offer a selection of understandable real world models that can be implemented directly from the multitude of mathematical resources

The author does not attempt to hide his preference of Numerical Mathematics and thus places importance on careful theoretical preparation Optimization and Optimal Control in Automotive Systems Harald Waschl, Ilya Kolmanovsky, Maarten Steinbuch, Luigi del Re, 2014-03-20 This book demonstrates the use of the optimization techniques that are becoming essential to meet the increasing stringency and variety of requirements for automotive systems It shows the reader how to move away from earlier approaches based on some degree of heuristics to the use of more and more common systematic methods Even systematic methods can be developed and applied in a large number of forms so the text collects contributions from across the theory methods and real world automotive applications of optimization Greater fuel economy significant reductions in permissible emissions new drivability requirements and the generally increasing complexity of automotive systems are among the criteria that the contributing authors set themselves to meet In many cases multiple and often conflicting requirements give rise to multi objective constrained optimization problems which are also considered Some of these problems fall into the domain of the traditional multi disciplinary optimization applied to system sub system or component design parameters and is performed based on system models others require applications of optimization directly to experimental systems to determine either optimal calibration or the optimal control trajectory control law Optimization and Optimal Control in Automotive Systems reflects the state of the art in and promotes a comprehensive approach to optimization in automotive systems by addressing its different facets by discussing basic methods and showing practical approaches and specific applications of optimization to design and control problems for automotive systems The book will be of interest both to academic researchers either studying optimization or who have links with the automotive industry and to industrially based engineers and automotive designers **Advances in Craniopharyngioma: From Physiology to**

Analysis and Control of Cellular Ensembles. Exploiting dimensionality reduction in single-cell data and models Karsten Kuritz, 2020-11-20 An ensemble system is a collection of nearly identical dynamical systems which admit a certain degree of heterogeneity and which are subject to the restriction that they may only be manipulated or observed as a whole This thesis presents analysis and control methods for cellular ensembles by considering reduced 1 dimensional dynamics of biological processes in high dimensional single cell data and models To be more specific we address the quest for real time analysis of biological processes within single cell data by introducing the measure preserving map of pseudotime into real time in short MAPiT MAPiT enables the reconstruction of temporal and spatial dynamics from single cell snapshot experiments In addition we propose a PDE constrained learning algorithm which allows for efficient inference of changes in cell cycle progression from time series single cell snapshot data The second part of this thesis is devoted to controlling a heterogeneous cell

population in the sense that we aim at achieving a desired distribution of cellular oscillators on their periodic orbit A systems theoretic approach to the ensemble control problem provides novel necessary and sufficient conditions for the control of phase distributions in terms of the Fourier coefficients of the phase response curve This thesis establishes a connection between the previously separate areas of single cell analysis and ensemble control Our holistic view opens new perspectives for theoretic concepts in basic research and therapeutic strategies in precision medicine

State Estimation for Nonlinear Continuous-Discrete Stochastic Systems Gennady Yu. Kulikov, Maria V. Kulikova, 2024-09-06 This book addresses the problem of accurate state estimation in nonlinear continuous time stochastic models with additive noise and discrete measurements Its main focus is on numerical aspects of computation of the expectation and covariance in Kalman like filters rather than on statistical properties determining a model of the system state Nevertheless it provides the sound theoretical background and covers all contemporary state estimation techniques beginning at the celebrated Kalman filter including its versions extended to nonlinear stochastic models and till the most advanced universal Gaussian filters with deterministically sampled mean and covariance In particular the authors demonstrate that when applying such filtering procedures to stochastic models with strong nonlinearities the use of adaptive ordinary differential equation solvers with automatic local and global error control facilities allows the discretization error and consequently the state estimation error to be reduced considerably For achieving that the variable stepsize methods with

automatic error regulation and stepsize selection mechanisms are applied to treating moment differential equations arisen. The implemented discretization error reduction makes the self adaptive nonlinear Gaussian filtering algorithms more suitable for application and leads to the novel notion of accurate state estimation. The book also discusses accurate state estimation in mathematical models with sparse measurements. Of special interest in this regard it provides a means for treating stiff stochastic systems which often encountered in applied science and engineering being exemplified by the Van der Pol oscillator in electrical engineering and the Oregonator model of chemical kinetics. Square root implementations of all Kalman like filters considered and explored in this book for state estimation in ill conditioned continuous discrete stochastic systems attract the authors particular attention. This book covers both theoretical and applied aspects of numerical integration methods including the concepts of approximation convergence stiffness as well as of local and global errors suitably for applied scientists and engineers. Such methods serve as a basis for the development of accurate continuous discrete extended unscented cubature and many other Kalman filtering algorithms including the universal Gaussian methods with deterministically sampled expectation and covariance as well as their mixed type versions. The state estimation procedures in this book are presented in the fashion of complete pseudo codes which are ready for implementation and use in MATLAB or in any other computation platform. These are examined numerically and shown to outperform traditional variants of the Kalman like filters in practical prediction filtering tasks including state estimations of stiff and or ill conditioned continuous discrete nonlinear stochastic systems.
