Center of Shanghai Ocean University China      *Dependable Multicore Architectures at Nanoscale* Marco Ottavi, Dimitris Gizopoulos, Salvatore Pontarelli, 2017-08-28 This book provides comprehensive coverage of the dependability challenges in today's advanced computing systems. It is an in-depth discussion of all the technological and design level techniques that may be used to overcome these issues and analyzes various dependability assessment methods. The impact of individual application scenarios on the definition of challenges and solutions is considered so that the designer can clearly assess the problems and adjust the solution based on the specifications in question. The book is composed of three sections beginning with an introduction to current dependability challenges arising in complex computing systems implemented with nanoscale technologies and of the effect of the application scenario. The second section details all the fault tolerance techniques that are applicable in the manufacture of reliable advanced computing devices. Different levels from technology level fault avoidance to the use of error correcting codes and system level checkpointing are introduced and explained as applicable to the different application scenario requirements. Finally the third section proposes a roadmap of future trends in and perspectives on the dependability and manufacturability of advanced computing systems from the special point of view of industrial stakeholders. *Dependable Multicore Architectures at Nanoscale* showcases the original ideas and concepts introduced into the field of nanoscale manufacturing and systems reliability over nearly four years of work within COST Action IC1103 MEDIAN a think tank with participants from 27 countries. Academic researchers and graduate students working in multi-core computer systems and their manufacture will find this book of interest as will industrial design and manufacturing engineers working in VLSI companies.

**Probability Based High Temperature Engineering** Leo Razdolsky, 2016-08-18 This volume on structural fire resistance is for aerospace structural and fire prevention engineers, architects and educators. It bridges the gap between prescriptive and performance based methods and simplifies very complex and comprehensive computer analyses to the point that the structural fire resistance and high temperature creep deformations will have a simple approximate analytical expression that can be used in structural analysis and design. The book emphasizes methods of the theory of engineering creep stress-strain diagrams and mathematical operations quite distinct from those of solid mechanics absent high temperature creep deformations. In particular the classical theory of elasticity and structural engineering. Dr. Razdolsky's previous books focused on methods of computing the ultimate structural design load to the different fire scenarios. The current work is devoted to the computing of the estimated ultimate resistance of the structure taking into account the effect of high temperature creep deformations. An essential resource for aerospace structural engineers who wish to improve their understanding of structure exposed to flare-up temperatures and severe fires, the book also serves as a textbook for introductory courses in fire safety in civil or structural engineering programs, vital reading for the PhD students in aerospace fire protection and structural engineering and a case study of a number of high-profile fires: the World Trade Center, Broadgate Phase 8, One Meridian Plaza, Mandarin Towers. *Probability Based High Temperature Engineering: Creep and*
