Homomorphic and Searchable Encryption Stefania Loredana Nita,Marius Iulian Mihailescu,2023-09-26 This book presents the current state of the literature on the fields of homomorphic and searchable encryption from both theoretical and practical points of view Homomorphic and searchable encryption are still relatively novel and rapidly evolving areas and face practical constraints in the contexts of large scale cloud computing and big data Both encryption methods can be quantum resistant if they use the right mathematical techniques In fact many fully homomorphic encryption schemes already use quantum resistant techniques such as lattices or characteristics of polynomials which is what motivated the authors to present them in detail On the one hand the book highlights the characteristics of each type of encryption including methods security elements security requirements and the main types of attacks that can occur On the other it includes practical cases and addresses aspects like performance limitations etc As cloud computing and big data already represent the future in terms of storing managing analyzing and processing data these processes need to be made as secure as possible and homomorphic and searchable encryption hold huge potential to secure both the data involved and the processes through which it passes This book is intended for graduates professionals and researchers alike Homomorphic and searchable encryption involve advanced mathematical techniques accordingly readers should have a basic background in number theory abstract algebra lattice theory and polynomial algebra   Elementary and Intermediate Algebra Marvin L.
