(b) 
$$(\frac{c}{2}, -d)(\frac{c}{4}, \frac{d}{4})$$
 $m : \frac{\frac{d}{4} - (-\frac{d}{4})}{4} = \frac{\frac{5d}{4}}{-\frac{c}{4}} : -\frac{5d}{6}$ 
 $m : \frac{1}{4} - \frac{2c}{6} = -\frac{c}{4} : -\frac{5d}{6}$ 

2.  $x^2 + 12x + 2 = 0$ , giving your answers correct to 1 decimal place.

nuclear energy and green fuels Though there are several technologies for power generation using the above sources efficient design of these systems still needs lot of research Mathematical modeling would play a vital role in design of state of the art technologies Advanced nuclear power plants need special mention since they involve naturally driven safety systems where the complex phenomena of boiling condensation and thermal stratification take place These are difficult to model as there is more than one phase coupled with turbulence models near wall phenomena coalescence and break up etc Scaling up of such systems and their innovative design to reduce stratification requires the help of mathematical modeling Other opportunities include Computational Fluid Dynamics CFD modeling for design of wind turbines for power generation using wind energy Power generation from biomass involves use of gasifiers which has complex set of reactions and mostly two or three phases which are difficult to model using CFD at industrial scales Ground Water Models National Research Council, Division on Engineering and Physical Sciences, Commission on Physical Sciences, Mathematics, and Applications, Committee on Ground Water Modeling Assessment, 1990-02-01 The discovery of toxic pollution at Love Canal brought ground water contamination to the forefront of public attention Since then ground water science and modeling have become increasingly important in evaluating contamination setting regulations and resolving liability issues in court A clearly written explanation of ground water processes and modeling Ground Water Models focuses on the practical aspects of model application It examines the role of models in regulation litigation and policy development explains ground water processes and describes specific applications for models presents emerging technologies and offers specific recommendations for better use of ground water science in policy formation Biodental Engineering V Jorge Belinha, R.M. can only produce a static description of the individual components of the immune system and the interactions between them Shifting our view of the immune system from a static schematic perception to a dynamic multi level system is a daunting task It requires the development of appropriate mathematical methodologies for the holistic and quantitative analysis of multi level molecular and cellular networks Their coordinated behavior is dynamically controlled via distributed feedback and feedforward mechanisms which altogether orchestrate immune system functions The molecular regulatory loops inherent to the immune system that mediate cellular behaviors e g exhaustion suppression activation and tuning can be analyzed using mathematical categories such as multi stability switches ultra sensitivity distributed system graph dynamics or hierarchical control GB is supported by the Russian Science Foundation grant 18 11 00171 AM is also supported by grants from the Spanish Ministry of Economy Industry and Competitiveness and FEDER grant no SAF2016 75505 R the Mar a de Maeztu Programme for Units of Excellence in R D MDM 2014 0370 and the Russian Science Foundation grant 18 11 00171
