**Houghton Mifflin Math Central: Student text**, 1998 **Security for Wireless Sensor Networks** Donggang Liu, Peng Ning, 2007-02-15 The recent technological advances have made it possible to deploy small low power low bandwidth and multi functional wireless sensor nodes to monitor and report the conditions and events in their local environments A large collection of these sensor nodes can thus form a wireless sensor network in an ad hoc manner creating a new type of information systems Such sensor networks have recently emerged as an important means to study and interact with the physical world and have received a lot of attention due to their wide applications in military and civilian operations such as target tracking and data acquisition However in many of these applications wireless sensor networks could be deployed in hostile environments where there are malicious attacks against the network Providing security services in sensor networks however turns out to be a very challenging task First sensor nodes usually have limited resources such as storage bandwidth computation and energy It is often undesirable to implement expensive algorithms e.g frequent public key operations on sensor nodes Second sensor nodes are usually deployed unattended and built without compromise prevention

in mind An attacker can easily capture and compromise a few sensor nodes without being noticed When sensor nodes are compromised the attacker can learn all the secrets stored on them and launch a variety of attacks Thus any security mechanism for sensor networks has to be resilient to compromised sensor nodes      **Intermediate Algebra** Alice Kaseberg,2000 Think of it as portable office hours The Interactive Video Skillbuilder CD ROM contains more than eight hours of video instruction The problems worked during each video lesson are shown next to the viewing screen so that student can try working them before watching the solution To help students evaluate their progress each section contains a 10 question Web quiz the results of which can be emailed to the instructor and each chapter contains a chapter test with answers to each problem on each test Also includes MathCue Tutorial software This dual platform software presents and scores problems and tutor students by displaying annotated step by step solutions Problem sets may be customized as desired      *Houghton Mifflin Math Central* Laurie Boswell,Patsy F. Basics of Applied Stochastic Processes Richard Serfozo, 2009-01-24 Stochastic processes are mathematical models of random phenomena that evolve according to prescribed dynamics Processes commonly used in applications are Markov chains in discrete and continuous time renewal and regenerative processes Poisson processes and Brownian motion This volume gives an in depth description of the structure and basic properties of these stochastic processes A main focus is on equilibrium distributions strong laws of large numbers and ordinary and functional central limit theorems for cost and performance parameters Although these results differ for various processes they have a common trait of being limit theorems for processes with regenerative increments Extensive examples and exercises show how to formulate stochastic models of systems as functions of a system's data and dynamics and how to represent and analyze cost and performance measures Topics include stochastic networks spatial and space time Poisson processes queueing reversible processes simulation Brownian approximations and varied Markovian models The technical level of the volume is between that of introductory texts that focus on highlights of applied stochastic processes and advanced texts that focus on theoretical aspects of processes
