Baumer, 2018-11-19 Analyzing Baseball Data with R Second Edition introduces R to sabermetricians baseball enthusiasts and students interested in exploring the richness of baseball data It equips you with the necessary skills and software tools to perform all the analysis steps from importing the data to transforming them into an appropriate format to visualizing the data via graphs to performing a statistical analysis The authors first present an overview of publicly available baseball datasets and a gentle introduction to

the type of data structures and exploratory and data management capabilities of R. They also cover the ggplot2 graphics functions and employ a tidyverse friendly workflow throughout. Much of the book illustrates the use of R through popular sabermetrics topics including the Pythagorean formula, runs expectancy, catcher framing, career trajectories, simulation of games and seasons, patterns of streaky behavior of players and launch angles and exit velocities. All the datasets and R code used in the text are available online. New to the second edition are a systematic adoption of the tidyverse and incorporation of Statcast player tracking data made available by Baseball Savant. All code from the first edition has been revised according to the principles of the tidyverse. Tidyverse packages including dplyr, ggplot2, tidyr, purrr and broom are emphasized throughout the book. Two entirely new chapters are made possible by the availability of Statcast data: one explores the notion of catcher framing ability and the other uses launch angle and exit velocity to estimate the probability of a home run. Through the book's various examples you will learn about modern sabermetrics and how to conduct your own baseball analyses.

*Modern Data Visualization with R* Robert Kabacoff, 2024-03-29. *Modern Data Visualization with R* describes the many ways that raw and summary data can be turned into visualizations that convey meaningful insights. It starts with basic graphs such as bar charts, scatter plots, and line charts but progresses to less well known visualizations such as tree maps, alluvial plots, radar charts, mosaic plots, effects plots, correlation plots, biplots, and the mapping of geographic data. Both static and interactive graphics are described, and the use of color, shape, shading, grouping, annotation, and animations are covered in detail. The book moves from a default look and feel for graphs to graphs with customized colors, fonts, legends, annotations, and organizational themes.

**Features:** Contains a wide breadth of graph types including newer and less well known approaches. Connects each graph type to the characteristics of the data and the goals of the analysis. Moves the reader from simple graphs describing one variable to building visualizations that describe complex relationships among many variables. Provides newer approaches to creating interactive web graphics via JavaScript libraries. Details how to customize each graph type to meet users' needs and those of their audiences. Gives methods for creating visualizations that are publication ready for print in color or black and white and the web. Suggests best practices. Offers examples from a wide variety of fields. The book is written for those new to data analysis as well as the seasoned data scientist. It can be used for both teaching and research and will particularly appeal to anyone who needs to describe data visually and wants to find and emulate the most appropriate method quickly. The reader should have some basic coding experience, but expertise in R is not required. Some of the later chapters, e.g., visualizing statistical models, assume exposure to statistical inference at the level of analysis of variance and regression.
