A 4-month-old client is brought to the pediatric emergency department reporting that something is just not right with him. They can't really explain it, but they recognize that he is just behaving differently. The healthcare provider (HCP) completes a thorough assessment and finds that the client is in heart failure (HF) and suspects that he has a ventricular septal defect (VSD), a congenital heart defect.

Which clinical manifestations would the nurse expect to assess in an infant diagnosed with ventricular septal defect (VSD)?

Tachypnea and grunting with intercostal and subcostal retractions.

The nurse understands that a child is experiencing heart failure when which symptoms are found?

Cool extremities

Peripheral edema

Nasal Flaring

Heart failure (HF) in a pediatric client is most often manifested by which symptoms?

Frequent feedings with irritability and poor suckling.

The pediatric cardiologist schedules a cardiac catheterization for the next day. The nurse prepares the family and the client for the procedure by answering questions that the family is asking.

What should the nurse include when teaching the client's parents about post-procedure care?

Explain that they will need to hold the clients in the prone position after the procedure.

As the nurse obtains informed consent for the client's cardiac catheterization, The client says, "I am still not exactly sure why the doctor has to do the test."

Which action should the nurse implement?

Notify the cardiologist and do not allow the parent to sign the permit.

When preparing the client's nursing care plan, the nurse identifies the priority nursing diagnosis as "decreased cardiac output."

Which nursing intervention must be included in the client's plan of care related to this diagnosis?

Assess the infant's peripheral pulses and capillary refill.

Which response is most important for the nurse to educate the parents about feeding?

"Your son will be able to suck more easily and will not be so tired from feeding."

The client's mother begins to cry and says, "I want my child to be able to have an easier time eating, but I think breast milk is best for him. It is more easily digested and contains immune properties that he needs. Isn't there anything you can do?" As a client and family advocate, the nurse decides to explore the mother's request further since he is not due to

***Congenital Heart Disease: from Diagnosis to Treatment*** Curtis Giguère, 2020-03-02 Congenital Heart Disease From Diagnosis to Treatment opens with a review of the most common forms of congenital heart disease in pregnancy outlines preconception counseling discusses the associated morbidity and mortality of each lesion and reviews current recommendations for the management of congenital heart disease in pregnancy Women with congenital heart

disease represent over 50% of patients with cardiac disease in pregnancy today Formerly characterized by high rates of maternal morbidity and mortality the authors explore how advancements in medical management and surgical intervention are responsible for increasing numbers of women with congenital heart defects experiencing safe and successful pregnancies Additionally the authors discuss cardiac resynchronization therapy in adults with congenital heart disease Treatment in the setting of heart failure is challenging due to heterogeneity of the underlying anatomy and physiology surgical scars residual shunts and valvular dysfunction Since donor hearts are scarce worldwide interest has increased for the application of cardiac resynchronization therapy in this relatively young population This compilation goes on to discuss the four different types of atrial septal defects categorized based on location and embryological development While bicuspid aortic valve is the most common congenital heart anomaly in adults atrial septal defects are not far behind accounting for 10 15% of congenital heart disease In the penultimate study the authors focus on the state of the liver in children with congenital heart disease and chronic heart failure Congenital heart disease represented ventricular septal defect in 26 7% of patients secondary atrial septal defect in 24 4% of children a double discharge of the main vessels of the right ventricle in 15 6% of patients common atrioventricular canal at 15 6% of children tetralogy of Fallot at 11 1% of patients etc The concluding study reviews the effects of high altitude effects on congenital heart disease in the Andean region and in Ecuador as a study case High altitude hypoxia presents numerous challenges to human health survival and reproduction because of decreased oxygen availability brought on by lowered barometric pressure at high elevations
