THE PERIODIC TABLE OF THE ELEMENTS
The periodic table is a chart that lists all the elements known to science. It is organized into rows and columns based on their chemical and physical properties.

THE PERIODIC TABLE OF THE ELEMENTS

The periodic table of the elements, Figure 2.1, is a tabular arrangement of the elements that is based on their atomic number (Z), which is the number of protons in the nucleus of an atom. The elements are arranged in rows and columns such that elements with similar chemical and physical properties are placed in the same group or column. The periodic table is a fundamental tool in chemistry, used to predict the properties of elements and to understand the periodic trends in chemical behavior.

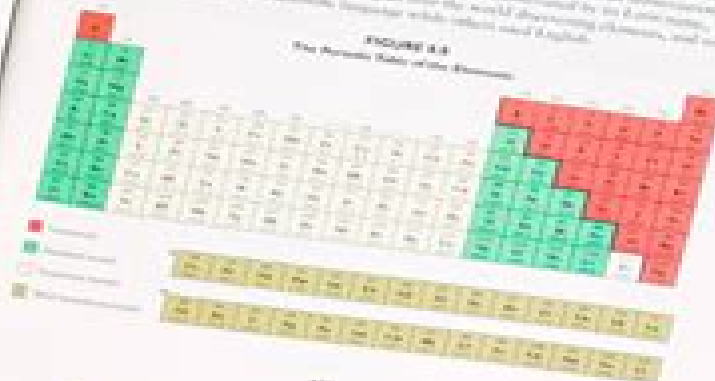

The periodic table is divided into four main blocks: the s-block, the p-block, the d-block, and the f-block. The s-block contains the elements in groups 1 and 2, the p-block contains the elements in groups 13 through 18, the d-block contains the transition metals in groups 3 through 10, and the f-block contains the lanthanides and actinides.

The periodic table is also divided into metals, nonmetals, and metalloids. Metals are located on the left side of the table, nonmetals on the right side, and metalloids along the diagonal line between them.

The periodic table is a powerful tool for understanding the periodic trends in chemical behavior. These trends include atomic size, ionization energy, electronegativity, and metallic character. The periodic table is also used to predict the properties of elements and to understand the periodic trends in chemical behavior.
