Mike Ebberts,Dino Tonelli,Jason Arnold,Patric Becker,Yuan-Chi Chang,Willie Favero,Shantan Kethireddy,Nin Lei,Shirley Lin,Ron Lounsbury,Susan Widing Lynch,Cristian Molaro,Deepak Rangarao,Michael Schapira,IBM Redbooks,2010-12-03

As business cycles speed up many customers gain significant competitive advantage from quicker and more accurate business decision making by using real data For many customers choosing the path to co locate their transactional and analytical workloads on System z better leverages their existing investment in hardware software and skills We created a project to address a number of best practice questions on how to manage these newer analytical type workloads especially when co located with traditional transactional workloads The goal of this IBM Redbooks publication is to provide technical guidance and performance trade offs associated with resource management and potentially DB2 data sharing in a variety of mixed transactional data warehouse System z topologies The term co location used here and in the rest of the book is specifically defined as the practice of housing both transactional OLTP and data warehouse analytical workloads within the same System z configuration We also assumed that key portions of the transactional and data warehouse databases would reside on DB2 for z OS The databases may or may not reside in a DB2 data sharing environment we discuss those pros and cons in this book The intended audience includes DB2 data warehouse architects and practitioners who are facing choices in resource management and system topologies in the data warehouse arena This specifically includes Business Intelligence BI administrators DB2 database administrators DBAs and z OS performance administrators systems programmers In addition decision makers and architects can utilize this book to assist in making platform and database topology decisions The book is divided into four parts Part I Introducing the co location project covers the System z value proposition and why one should consider System z as the central platform for their data warehousing business analytics needs Some topics are risk avoidance via data consolidation continuous availability simplified disaster recovery IBM Smart Analytics Optimizer reduced network bandwidth requirements and the unique virtualization and resource management capabilities of System z LPAR z VM and WLM Part I also provides some of the common System z co location topologies along with an explanation of the general pros and cons of each This would be useful input for an architect to understand where a customer is today and where they might consider moving to Part II Project environment covers the environment products workloads workload drivers and data models implemented for this study The environment consisted of a logically partitioned z10TM 32way running z VM Linux

and z OS operating system instances On those instances we ran products such as z OS DB2 V9 IBM Cognos Business Intelligence Version 8.4 for Linux on System z InfoSphere™ Warehouse for System z InfoSphere Change Data Capture z OS WebSphere V7 Tivoli Omegamon for DB2 Performance expert Utilizing these products we created transactional OLTP data warehouse query and data warehouse refresh workloads All the workloads were based on an existing web based transactional Bookstore workload that is currently utilized for internal testing within the System p and z labs While some IBM Cognos BI and ISWz product usage and experiences information is covered in this book we do not go into the depth typically found in IBM Redbooks publications since there is another book focused specifically on that

Optimal operation, configuration and sizing of energy storage and energy conversion technologies for residential house energy systems Tobias Alexander Beck, 2020-06-23 In recent years a rapid growth in the interest in self consumption of electricity generated by distributed electricity generation technologies such as rooftop photovoltaic PV systems has been observed in the residential sector Due to this development future residential house energy systems will face an increased complexity with respect to operation system configuration and sizing of generation and storage technologies In this thesis a mixed integer linear programming model for the integrated operation configuration and sizing of house energy systems is developed and discussed with respect to its applicability to the specifics of self consumption in residential dwellings The conducted scenario analysis shows that over a wide range of assumptions PV is a robust measure to decrease the total cost of ownership for heat pump and gas boiler based house energy systems The existence of a feed in tariff and the electricity price structure have a much larger influence on the results than the energy price development A feed in tariff generally incentivizes larger PV systems with higher levels of self sufficiency whereas small demand driven PV systems with high levels of self consumption are favored in absence of a feed in tariff Overall the proposed model is regarded as applicable for the identified minimum flexibility requirements for the employed generation technologies The results from the scenario computations provide a clear

and robust picture of the role of electricity generation technologies and flexibility options for future house energy systems
