The Emerging Discipline of Quantitative Systems Pharmacology Tarek A. Leil, Sergey Ermakov, 2015-09-07 In 2011 the National Institutes of Health NIH in collaboration with leaders from the pharmaceutical industry and the academic community published a white paper describing the emerging discipline of Quantitative Systems Pharmacology QSP and recommended the establishment of NIH supported interdisciplinary research and training programs for QSP QSP is still in its infancy but has tremendous potential to change the way we approach biomedical research QSP is really the integration of two disciplines that have been increasingly

useful in biomedical research Systems Biology and Quantitative Pharmacology Systems Biology is the field of biomedical research that seeks to understand the relationships between genes and biologically active molecules to develop qualitative models of these systems and Quantitative Pharmacology is the field of biomedical research that seeks to use computer aided modeling and simulation to increase our understanding of the pharmacokinetics PK and pharmacodynamics PD of drugs and to aid in the design of pre clinical and clinical experiments The purpose of QSP modeling is to develop quantitative computer models of biological systems and disease processes and the effects of drug PK and PD on those systems QSP models allow testing of numerous potential experiments in silico to eliminate those associated with a low probability of success avoiding the potential costs of evaluating all of those failed experiments in the real world At the same time QSP models allow us to develop our understanding of the interaction between drugs and biological systems in a more systematic and rigorous manner As the need to be more cost efficient in the use of research funding increases biomedical researchers will be required to gain the maximum insight from each experiment that is conducted This need is even more acute in the pharmaceutical industry where there is tremendous competition to develop innovative therapies in a highly regulated environment combined with very high research and development R a lack of adequate graduate training programs and the lack of support from government agencies that fund biomedical research However there is an active community of researchers in the pharmaceutical industry the academic community and government agencies that develop QSP and quantitative systems biology models and apply them both to better characterize and predict drug pharmacology and disease processes as well as to improve efficiency and productivity in pharmaceutical R D

Baker,2017-12-01 This book addresses the point of intersection between cognition metacognition and culture in learning and teaching Science Technology Engineering and Mathematics STEM We explore theoretical background and cutting edge research about how various forms of cognitive and metacognitive instruction may enhance learning and thinking in STEM classrooms from K 12 to university and in different cultures and countries Over the past several years STEM education research has witnessed rapid growth attracting considerable interest among scholars and educators The book provides an updated collection of studies about cognition metacognition and culture in the four STEM domains The field of research cognition and metacognition in STEM education still suffers from ambiguity in meanings of key concepts that various researchers use This book is organized according to a unique manner Each chapter features one of the four STEM domains and one of the three themes cognition metacognition and culture and defines key concepts This matrix type organization opens a new path to knowledge in STEM education and facilitates its understanding The discussion at the end of the book integrates these definitions for analyzing and mapping the STEM education research Chapter 4 is available open access under a Creative Commons Attribution 4 0 International License via link [springer.com](https://www.springer.com)

Rigor and Structure John P. Burgess,2015 While we are commonly told that the distinctive method of mathematics is rigorous proof and that the special topic of mathematics is abstract structure there has been no agreement among mathematicians logicians or philosophers as to just what either of these assertions means John P Burgess clarifies the nature of mathematical rigor and of mathematical structure and above all of the relation between the two taking into account some of the latest developments in mathematics including the rise of experimental mathematics on the one hand and computerized formal proofs on the other hand The main theses of Rigor and Structure are that the features of mathematical practice that a large group of philosophers of mathematics the structuralists have attributed to the peculiar nature of mathematical objects are better explained in a different way as artefacts of the manner in which the ancient ideal of rigor is realized in modern mathematics Notably the mathematician must be very careful in deriving new results from the previous literature but may remain largely indifferent to just how the results in the previous literature were obtained from first principles Indeed the working mathematician may remain largely indifferent to just what the first principles are supposed to be and whether they are set

theoretic or category theoretic or something else Along the way to these conclusions a great many historical developments in mathematics philosophy and logic are surveyed Yet very little in the way of background knowledge on the part of the reader is presupposed
